Jet studies at CDF in Run II

Rob Snihur

University College London

for the CDF collaboration

Outline

Motivation

1. **Inclusive jet cross section**
2. **Dijet mass**
3. **Jet shapes**

Summary

Motivation

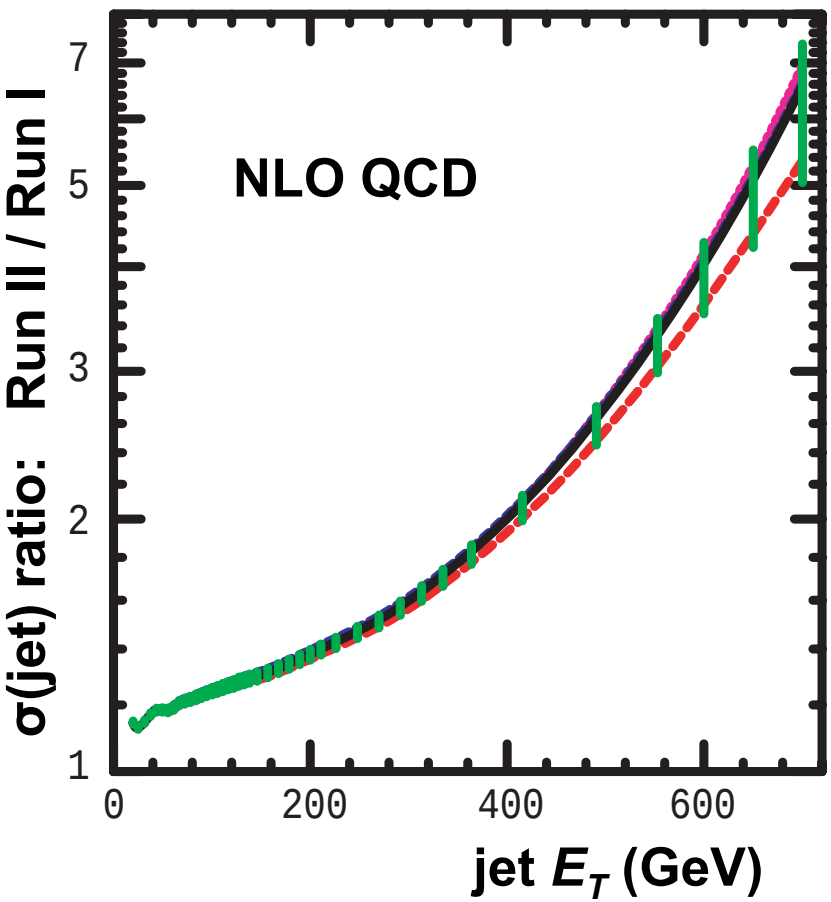
- Tevatron = jet factory
- Probe highest energy scales
  - Higher $\sqrt{s}$ ➔ higher σ (factor 3 for E_T > 500 GeV)
  - Already more jets than in Run I
- Test fixed-order QCD
  - look for deviations ➔ new physics
- Constrain PDFs
- Analyses:
  - Inclusive jet cross section (counting jets)
  - Dijet Mass (bump hunting)
  - Jet Shapes & Energy Flow

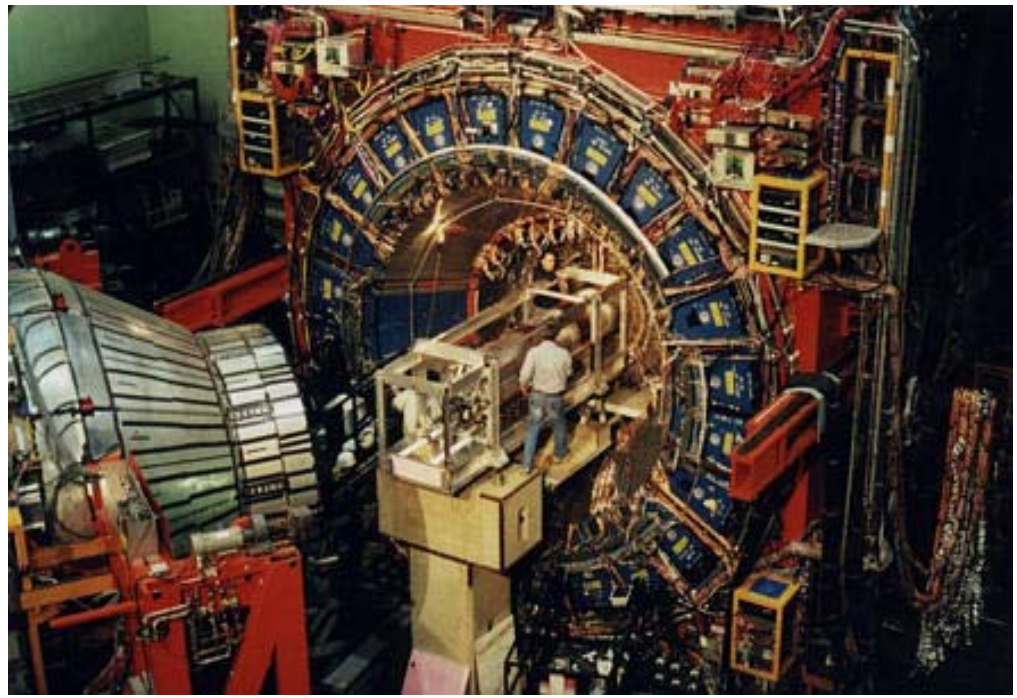
Tevatron & CDF

Upgraded Tevatron at Fermilab

$\sqrt{s}$ = 1.8 TeV ➔ 1.96 TeV

Higher σ(jet)





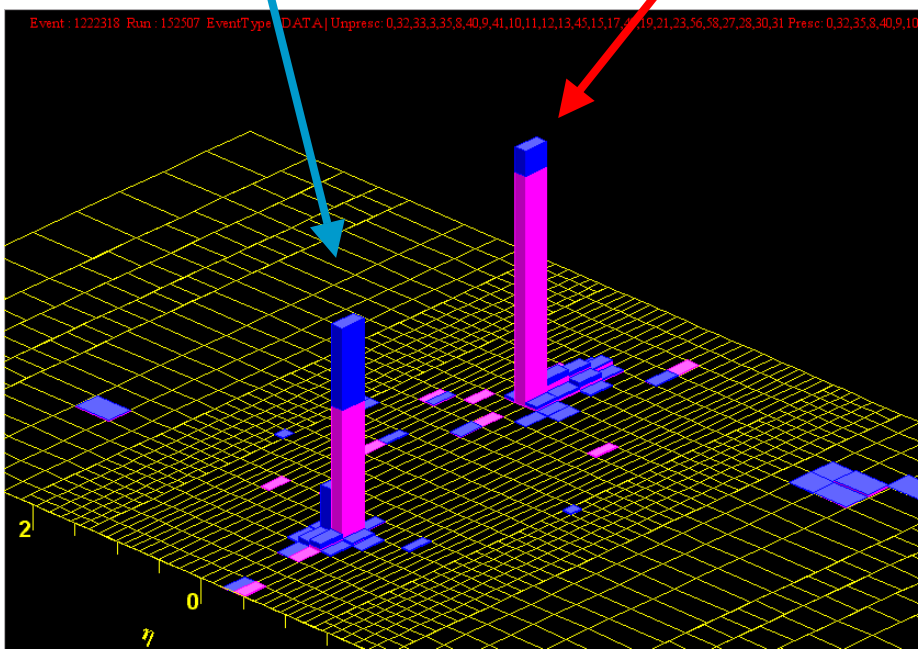
Collider Detector at Fermilab (CDF)

- **New plug calorimeter (1.1 < $|\eta|$ < 3.6)**
- **New tracking system**
- **Upgraded trigger**

Highest Energy Jets in Run II

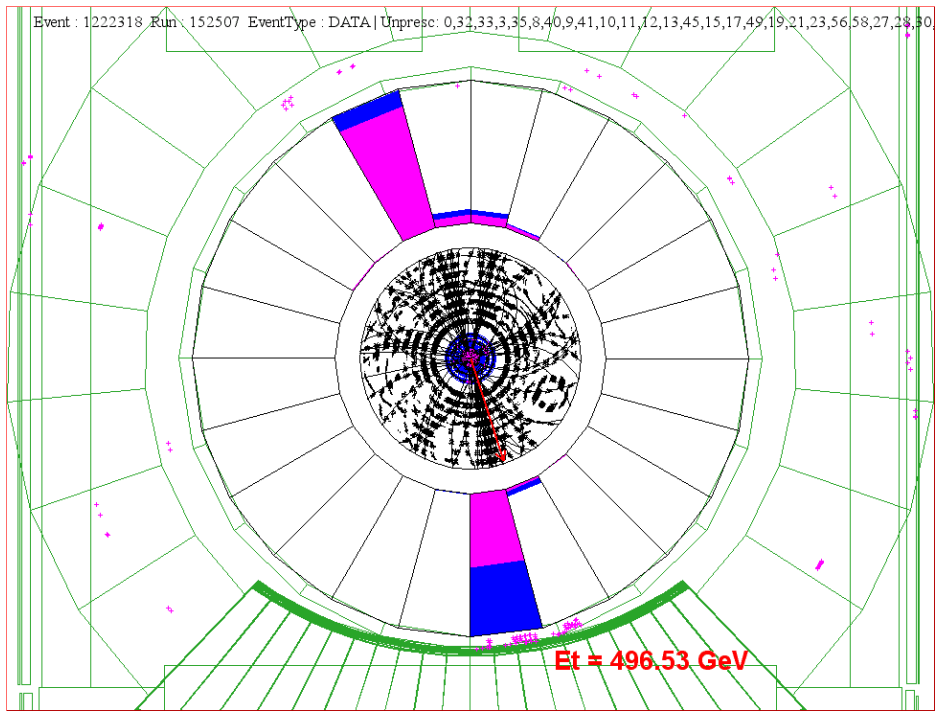
Jet 2
E_T = 546 GeV (raw)
η_{det} = -0.30

Jet 1
E_T = 583 GeV (raw)
η_{det} = 0.31



CDF Run II Preliminary

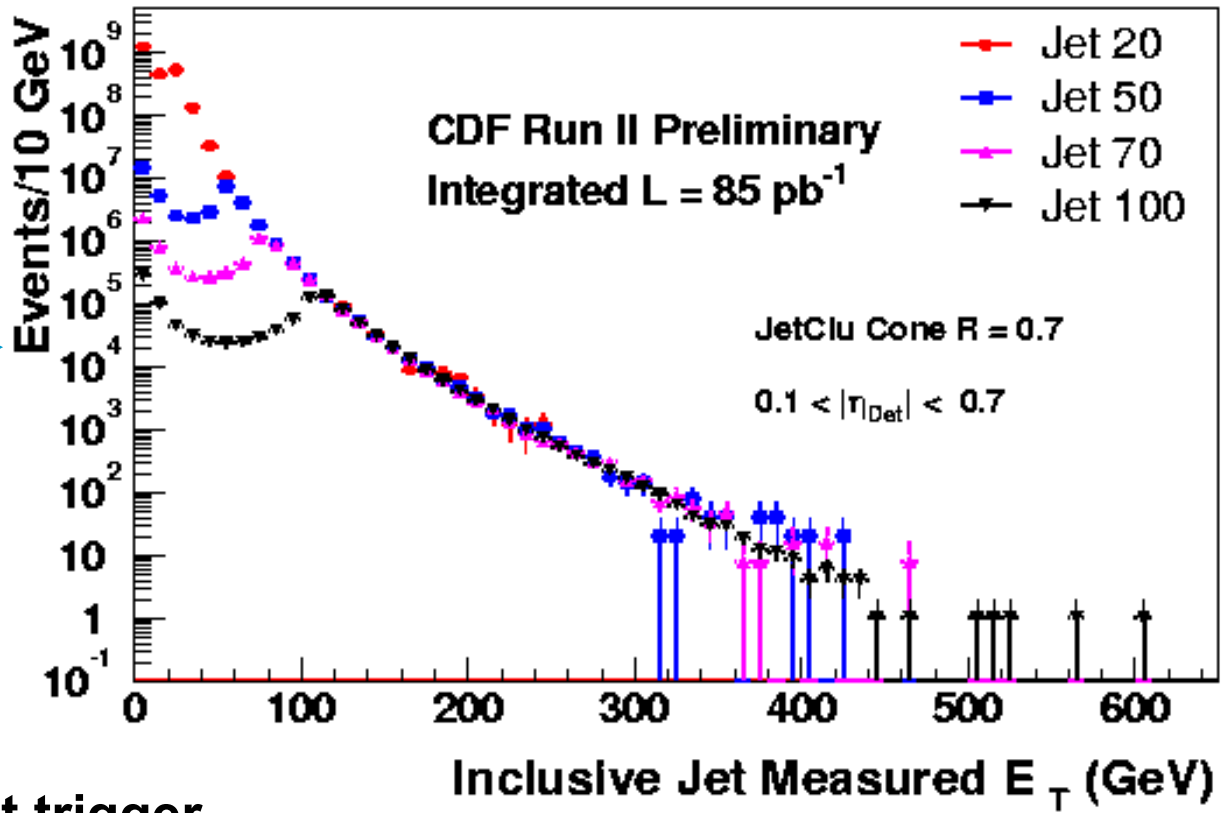
Run 152507 Event 1222318
Dijet Mass = 1364 GeV (corr)



Inclusive Jet Cross Section

- **Repeat Run I analyses**
  - **Use CDF cone jet algorithm with R = 0.7 (JetClu)**
- **Event selection cuts**
  - $|z_{vertex}| < 60$ cm
  - $\sum E_T < 1500$ GeV
  - $\not{E}_T / \sqrt{\sum E_T} < 2$ to 7

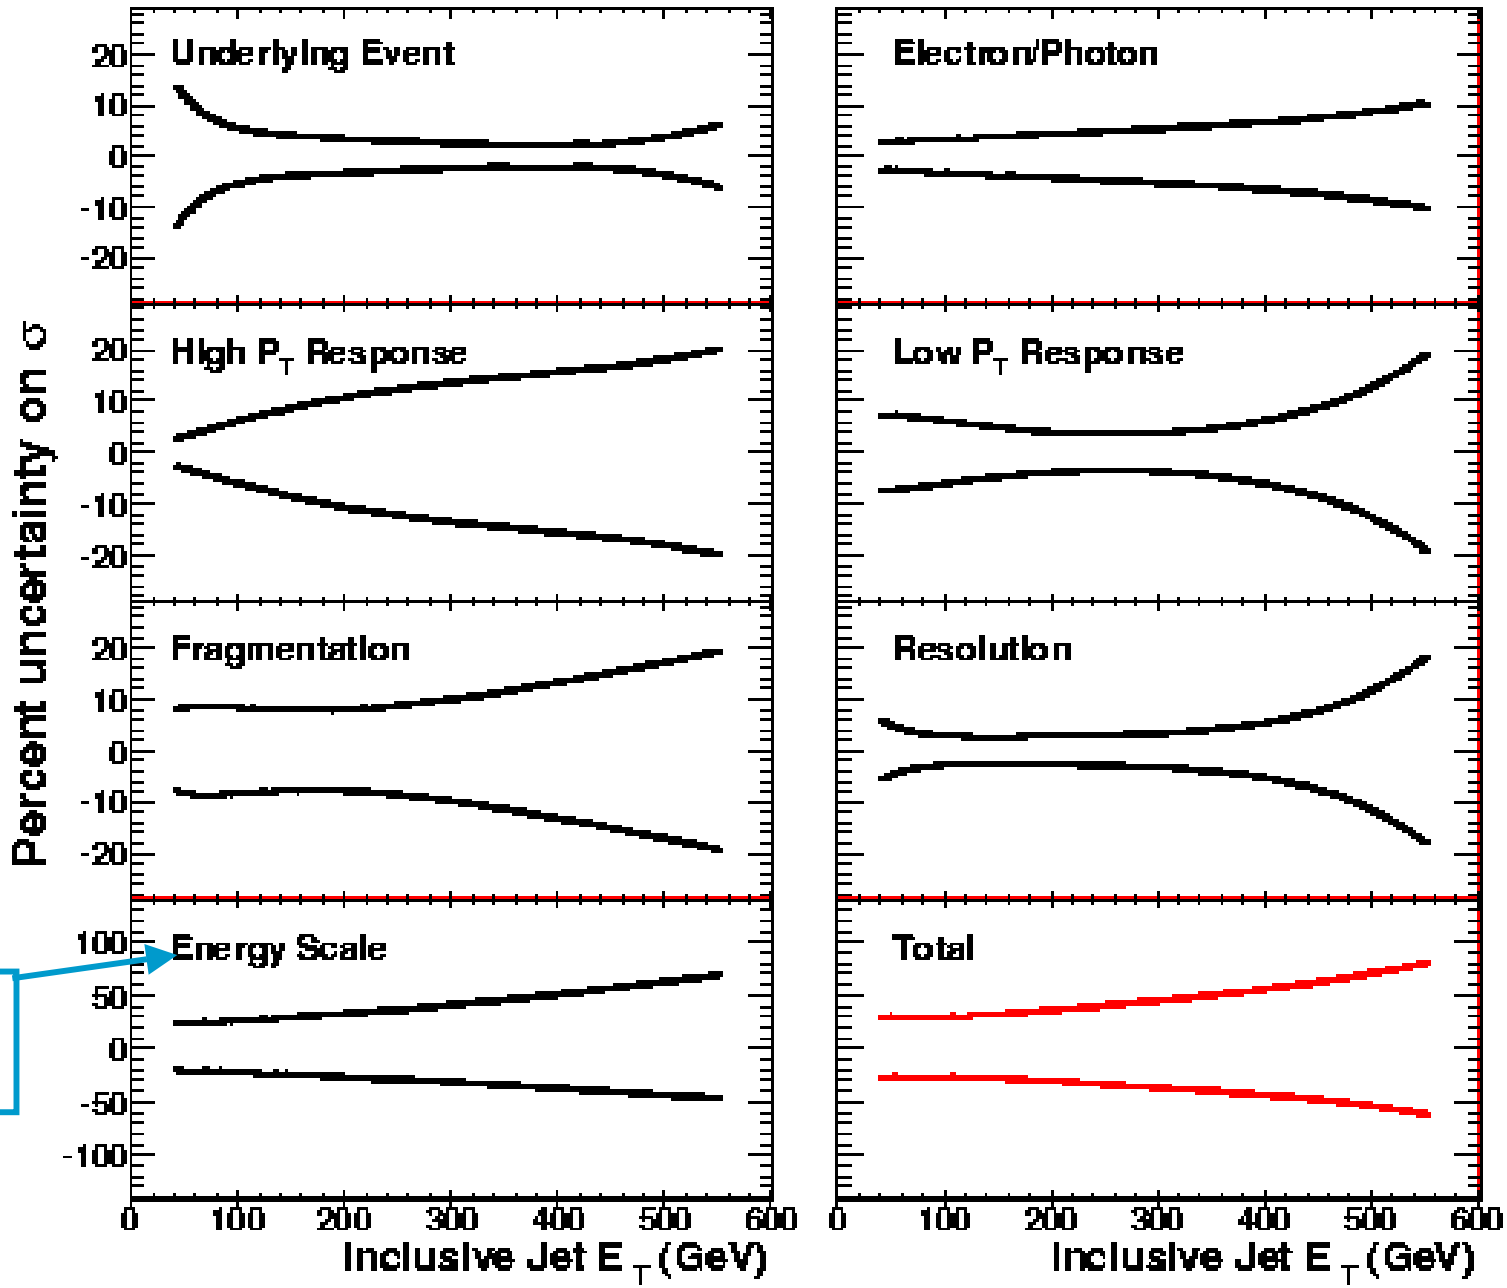
$$\frac{d\sigma}{dE_T} = \frac{N}{\varepsilon L \, \Delta E_T \, \Delta\eta}$$



- **Require fully efficient trigger**
- **Apply jet energy corrections (same as in Run I)**

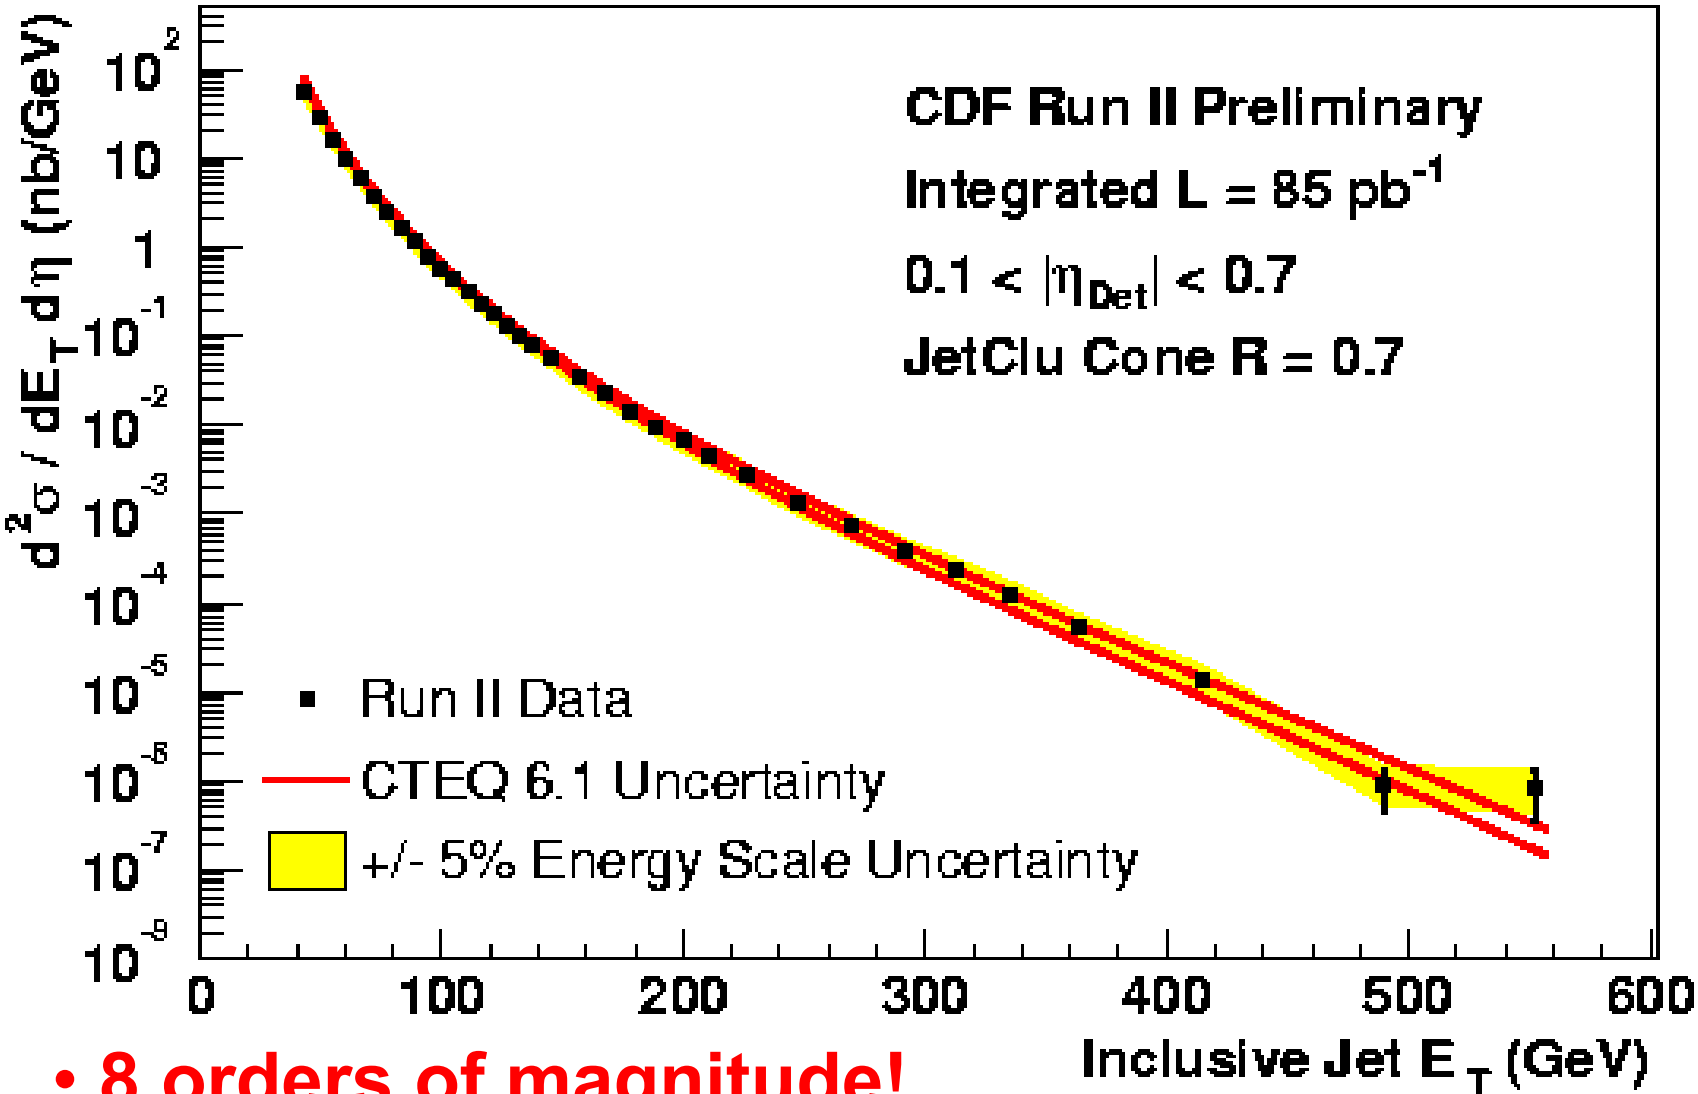
Systematic Uncertainties

Luminosity uncertainty = 6%



Largest uncertainty

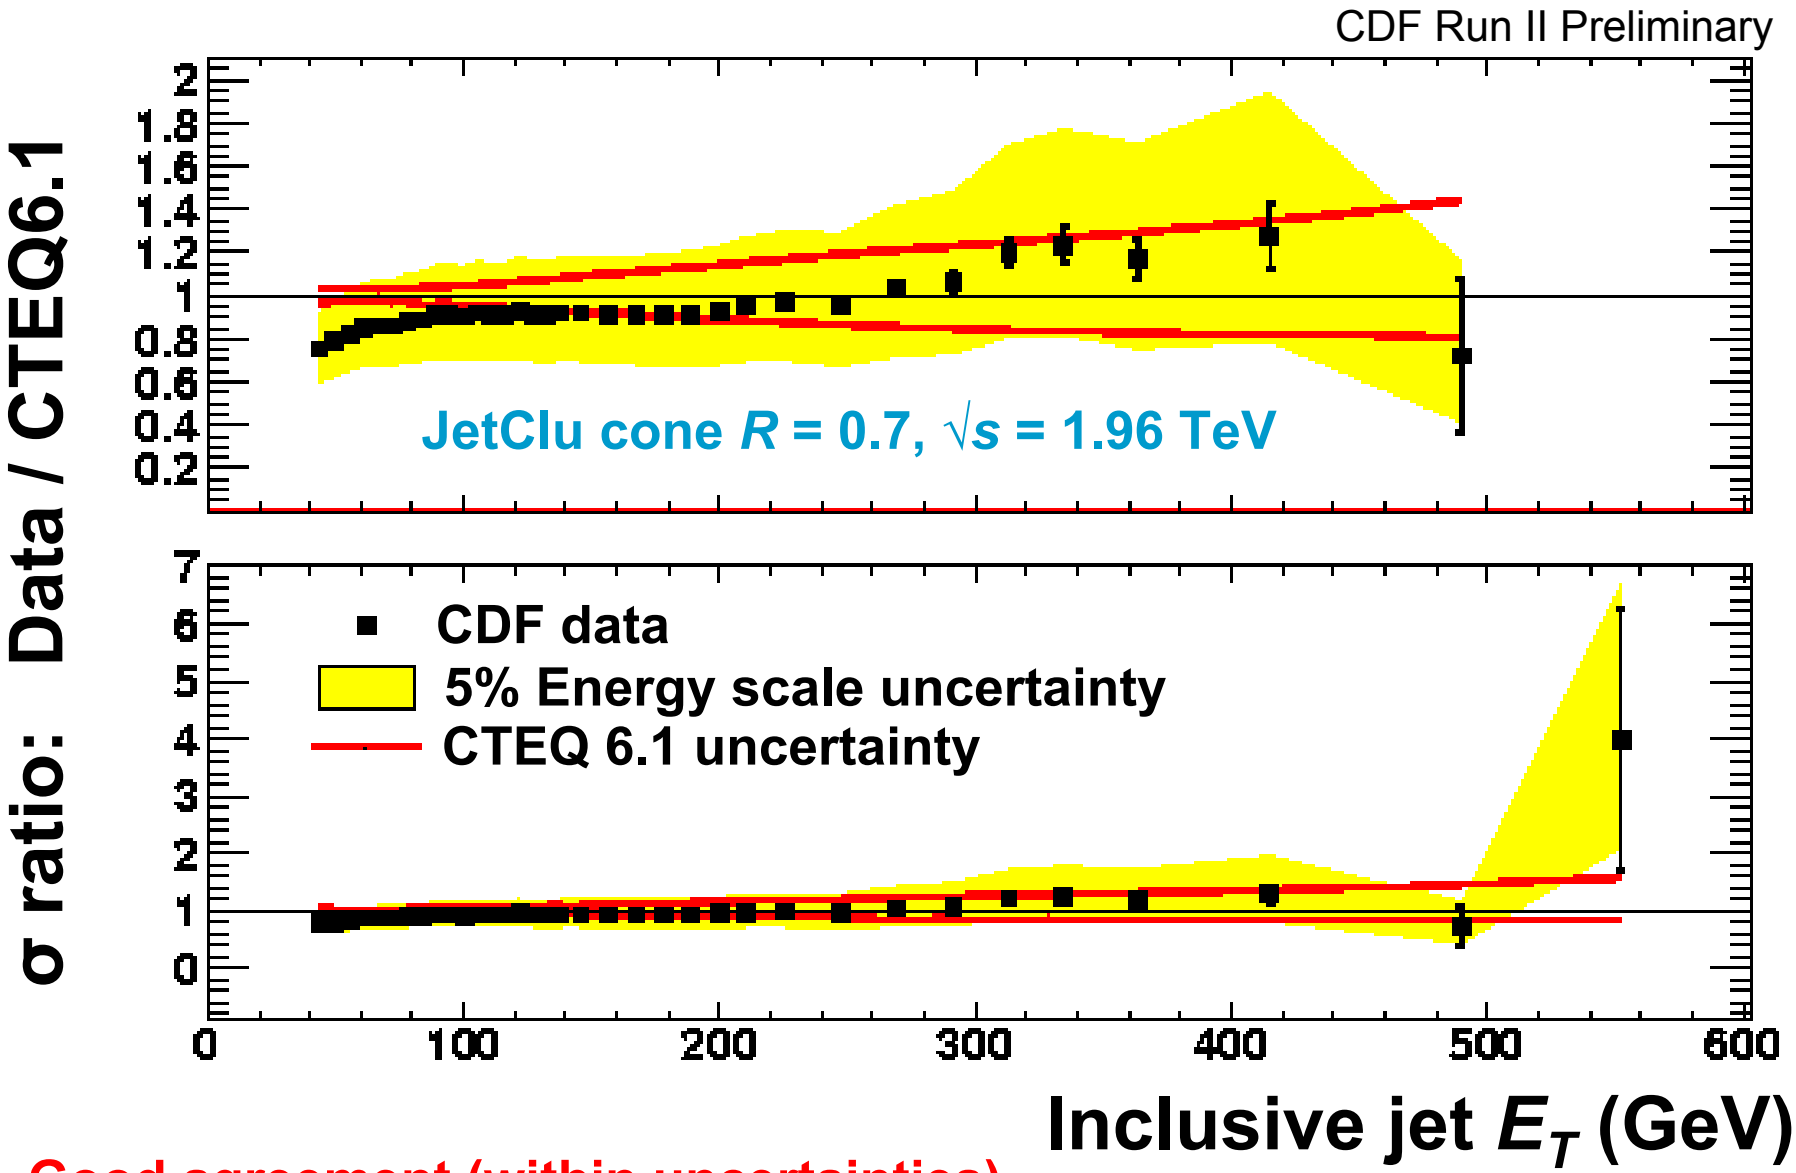
Corrected: Log



- **8 orders of magnitude!**
- **Highest E_T jets ever!**

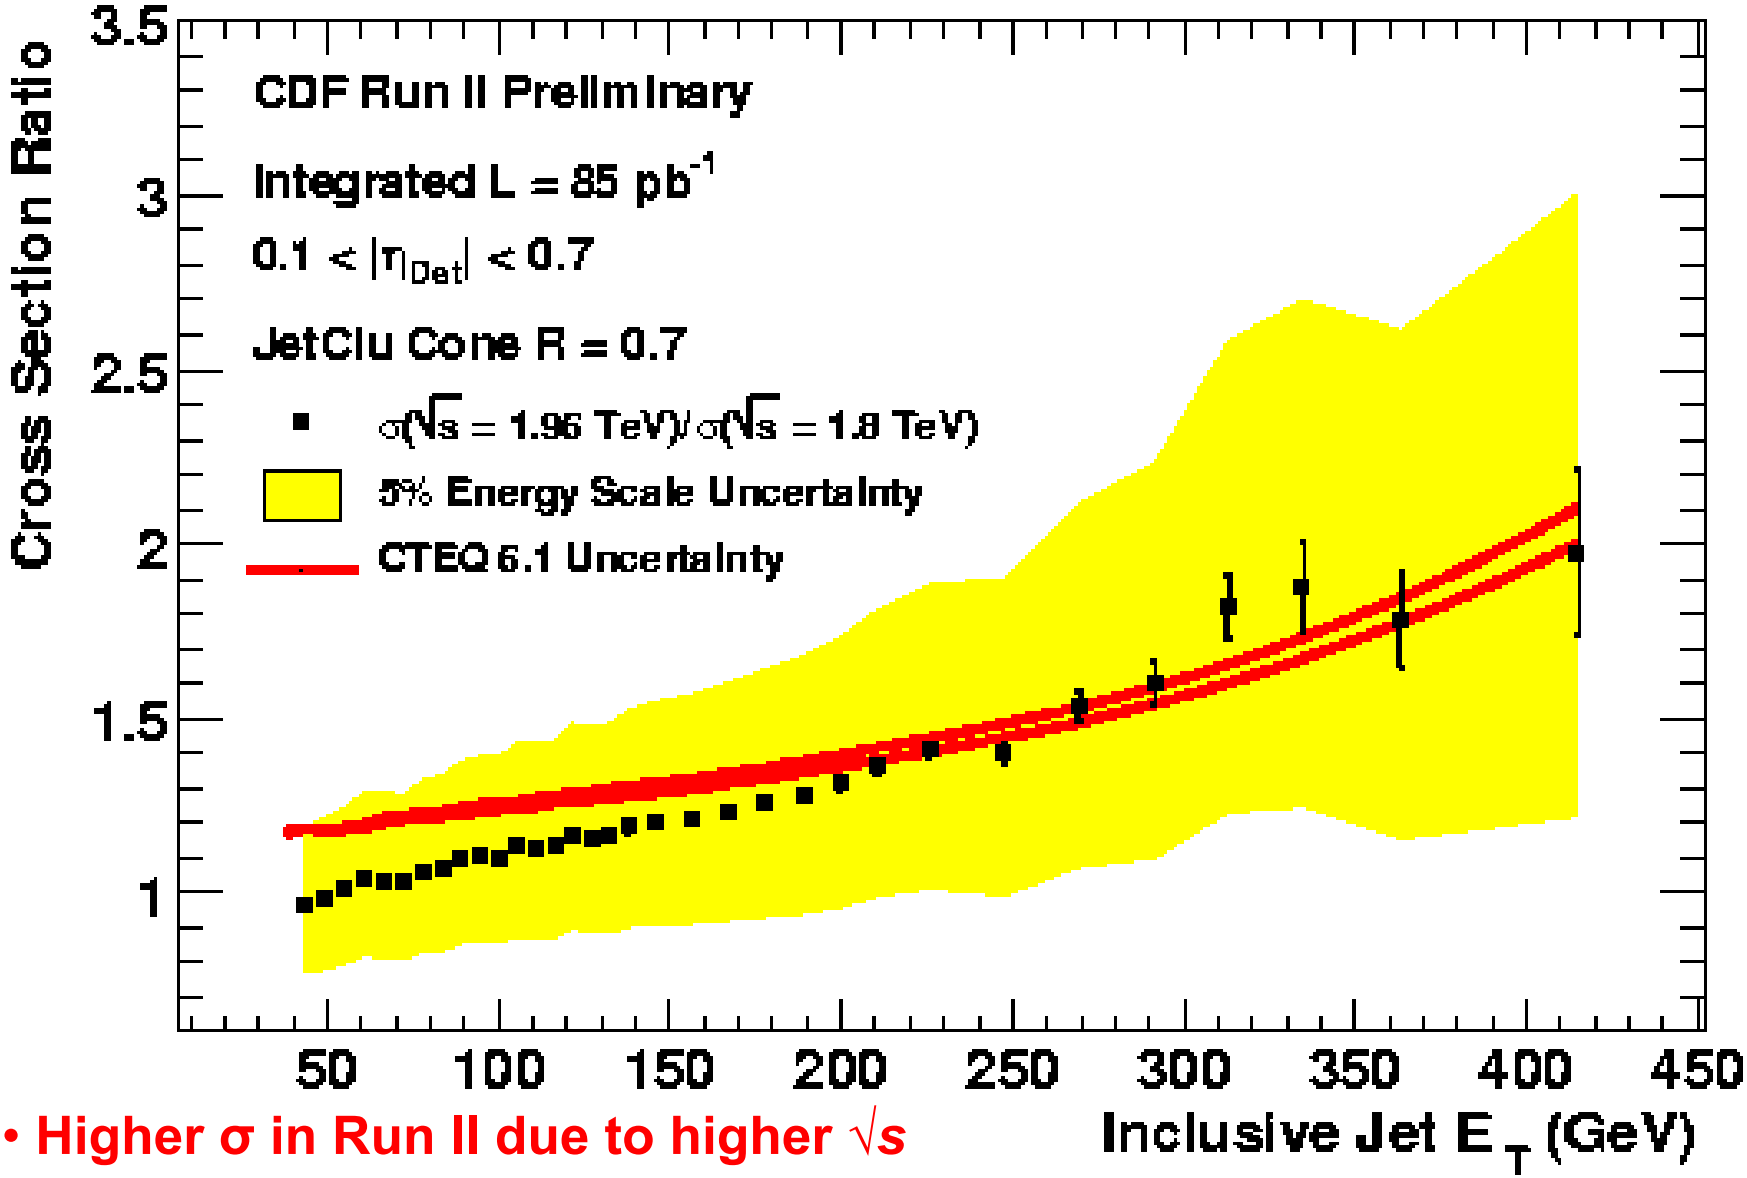
CTEQ 6.1: hep-ph/0303013

Corrected: Linear



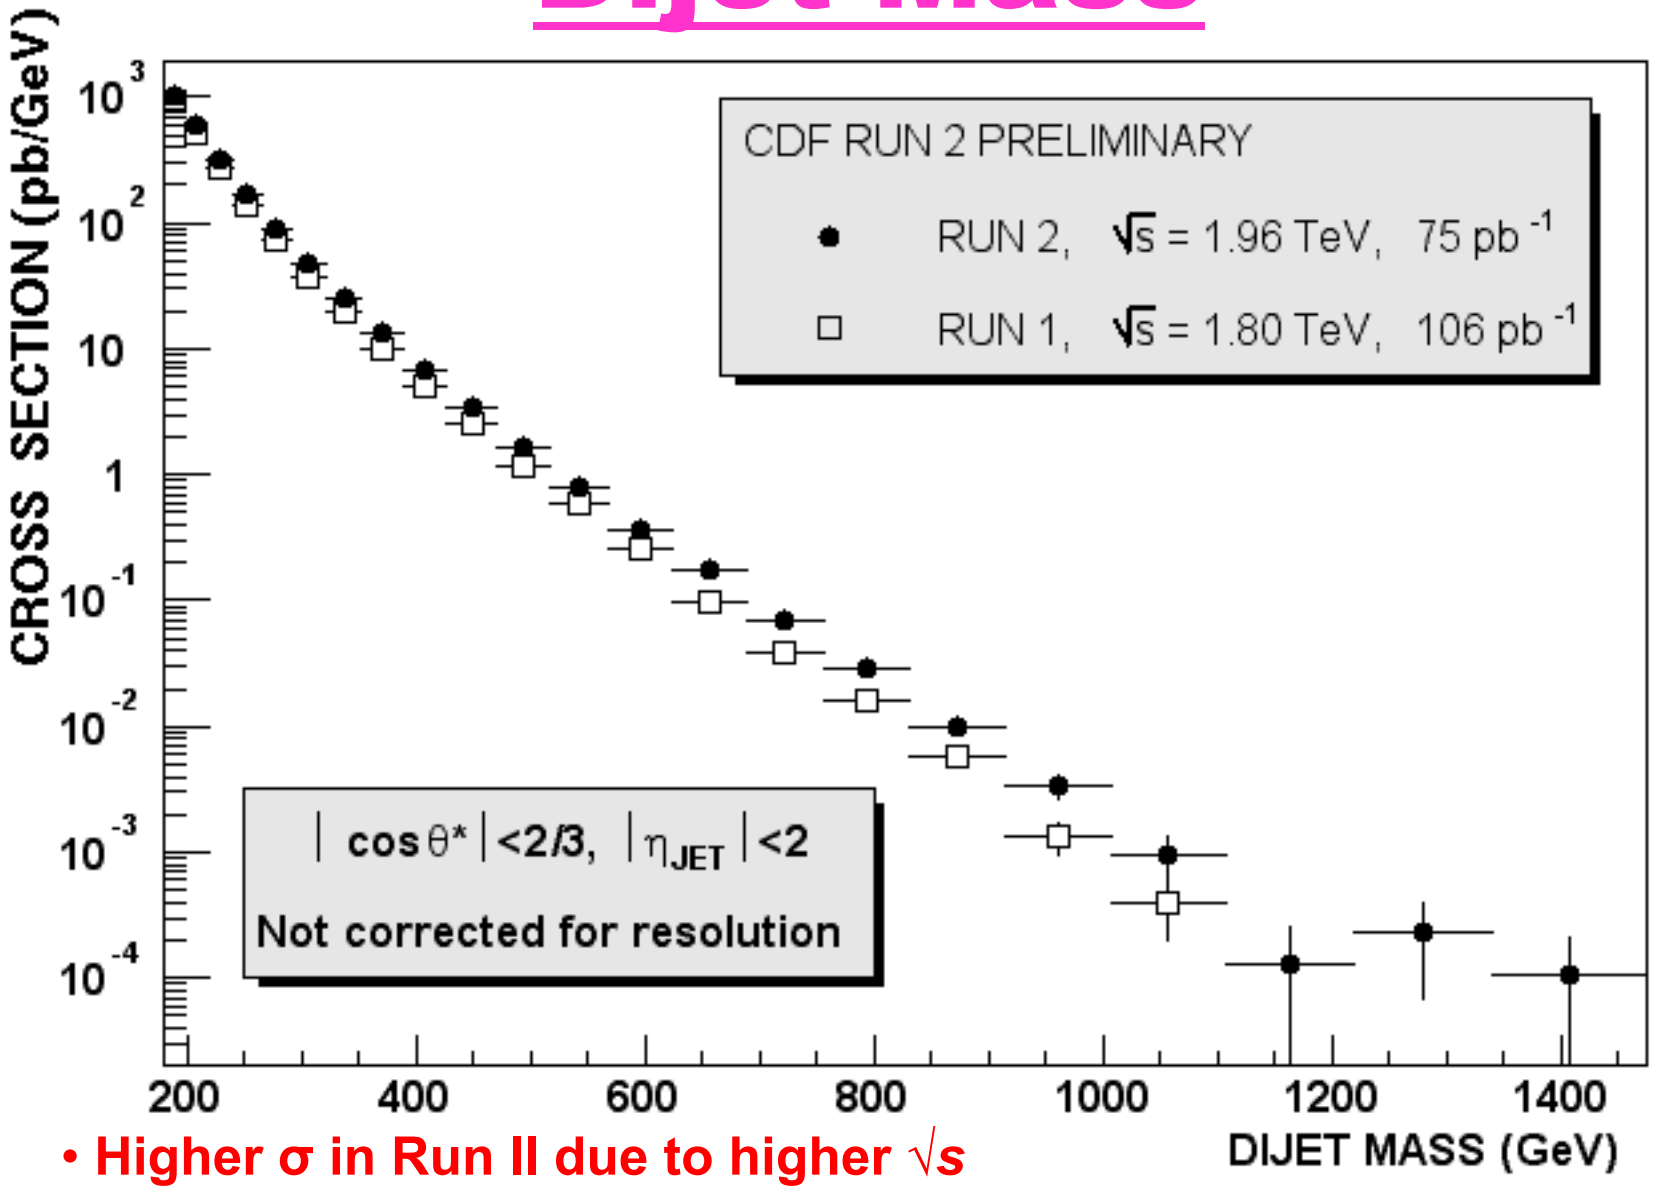
Good agreement (within uncertainties)

Run II & I



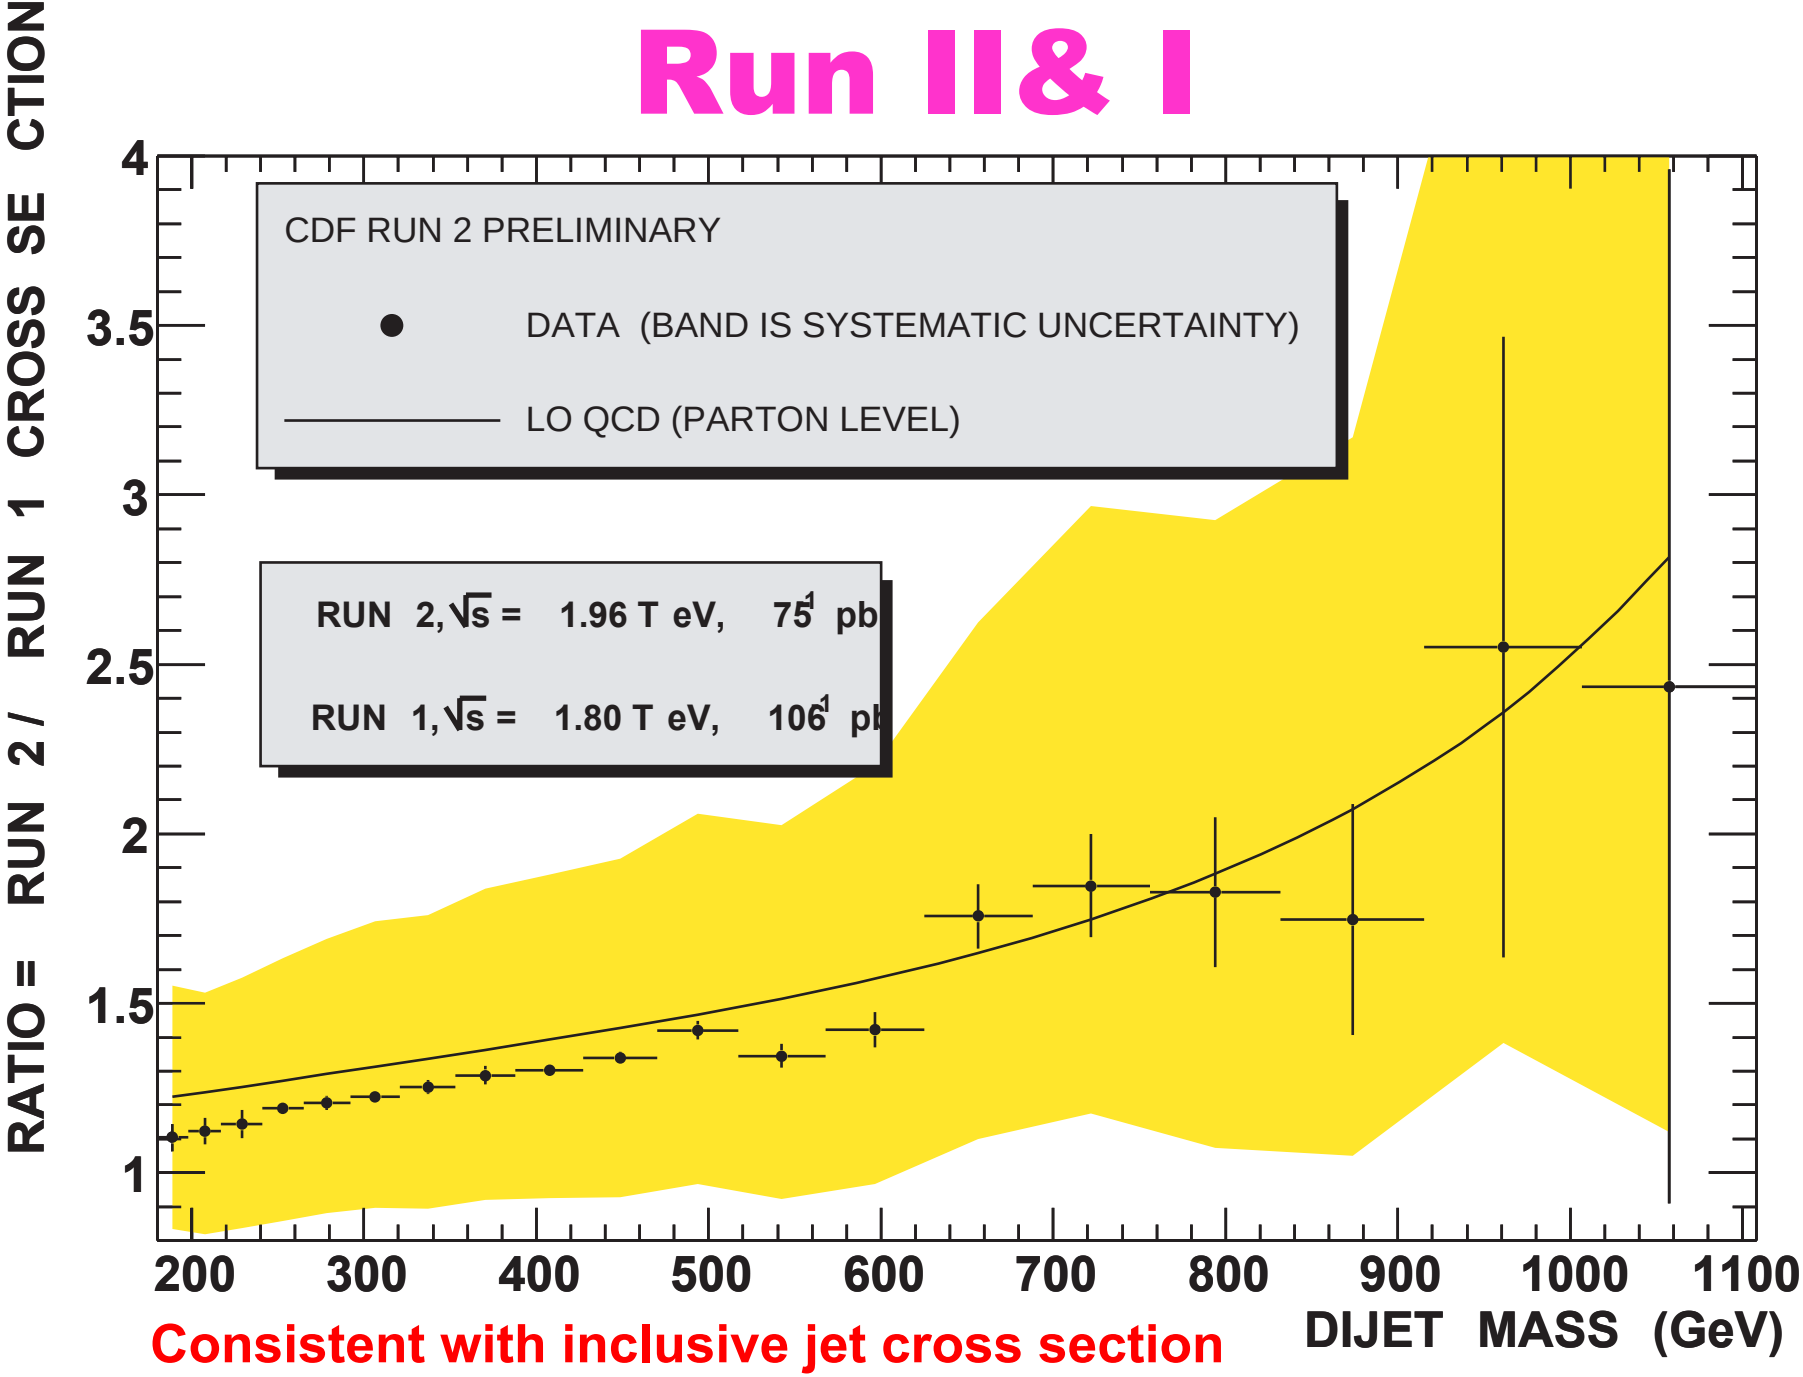
- Higher σ in Run II due to higher √s
- Many uncertainties cancel in the ratio

Dijet Mass



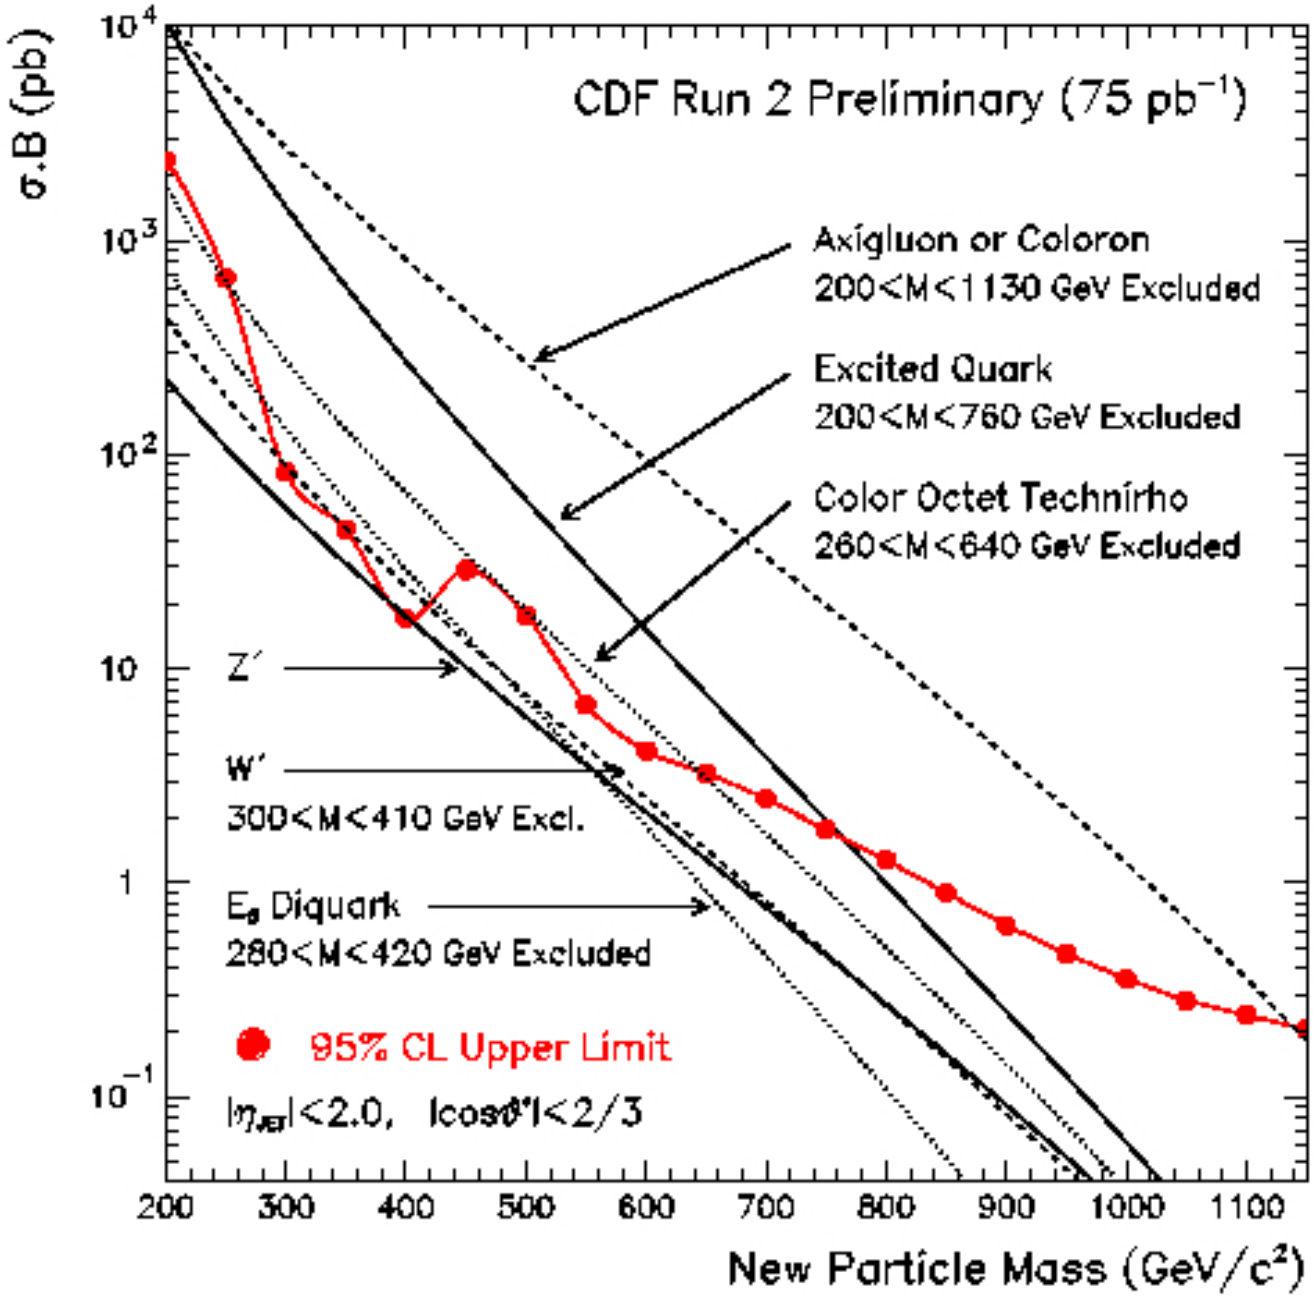
- Higher σ in Run II due to higher $\sqrt{s}$
- 3 more bins at high dijet mass!

Run II& I



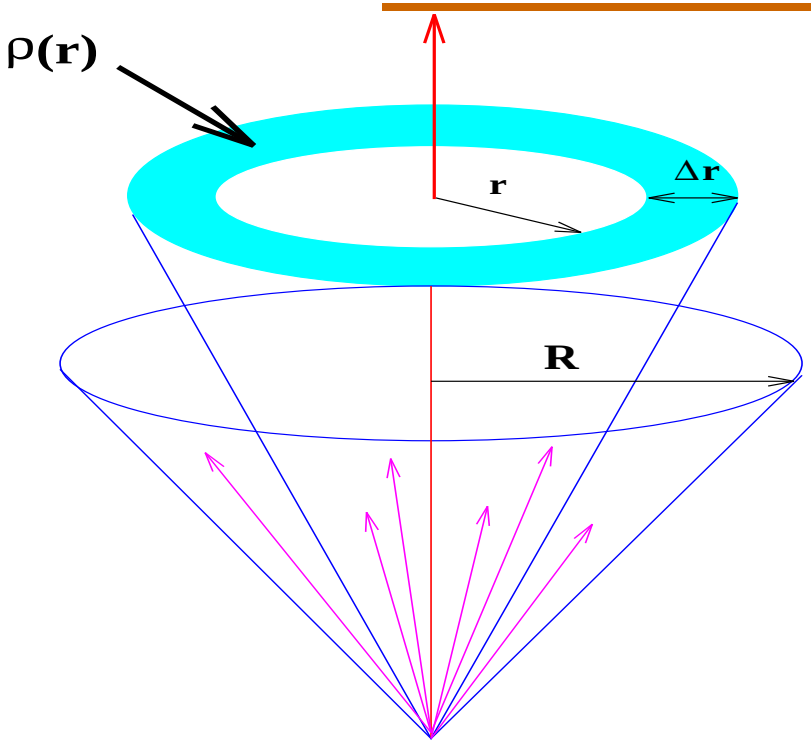
Consistent with inclusive jet cross section

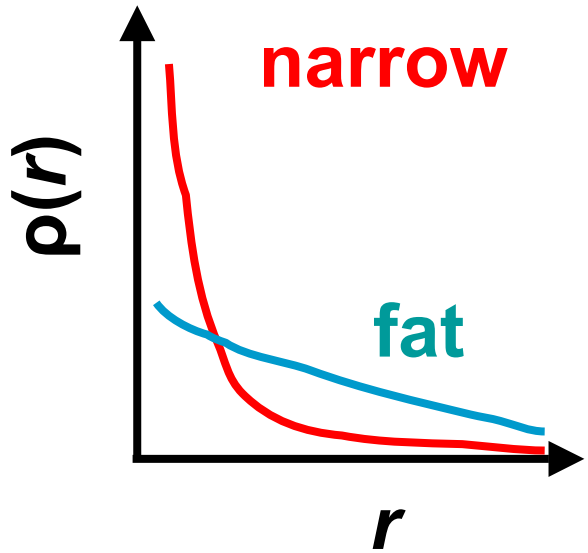
Limits



CDF Run 2 Preliminary (75 pb^{-1})
σ.B (pb)
New Particle Mass (GeV/c^2)
Axigluon or Coloron
200<M<1130 GeV Excluded
Excited Quark
200<M<760 GeV Excluded
Color Octet Technirho
260<M<640 GeV Excluded
Z′
W′
300<M<410 GeV Excl.
E$_6$ Diquark
280<M<420 GeV Excluded
95% CL Upper Limit
$|\eta_{jet}|<2.0$, $|\cos\theta^*|<2/3$

Jet Shapes



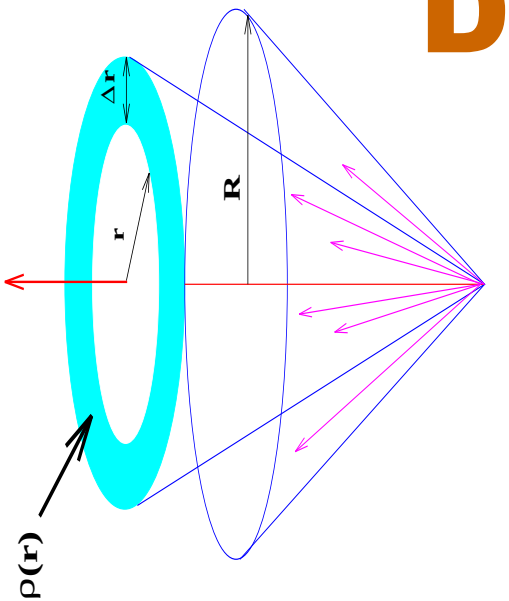


Differential jet shape definition

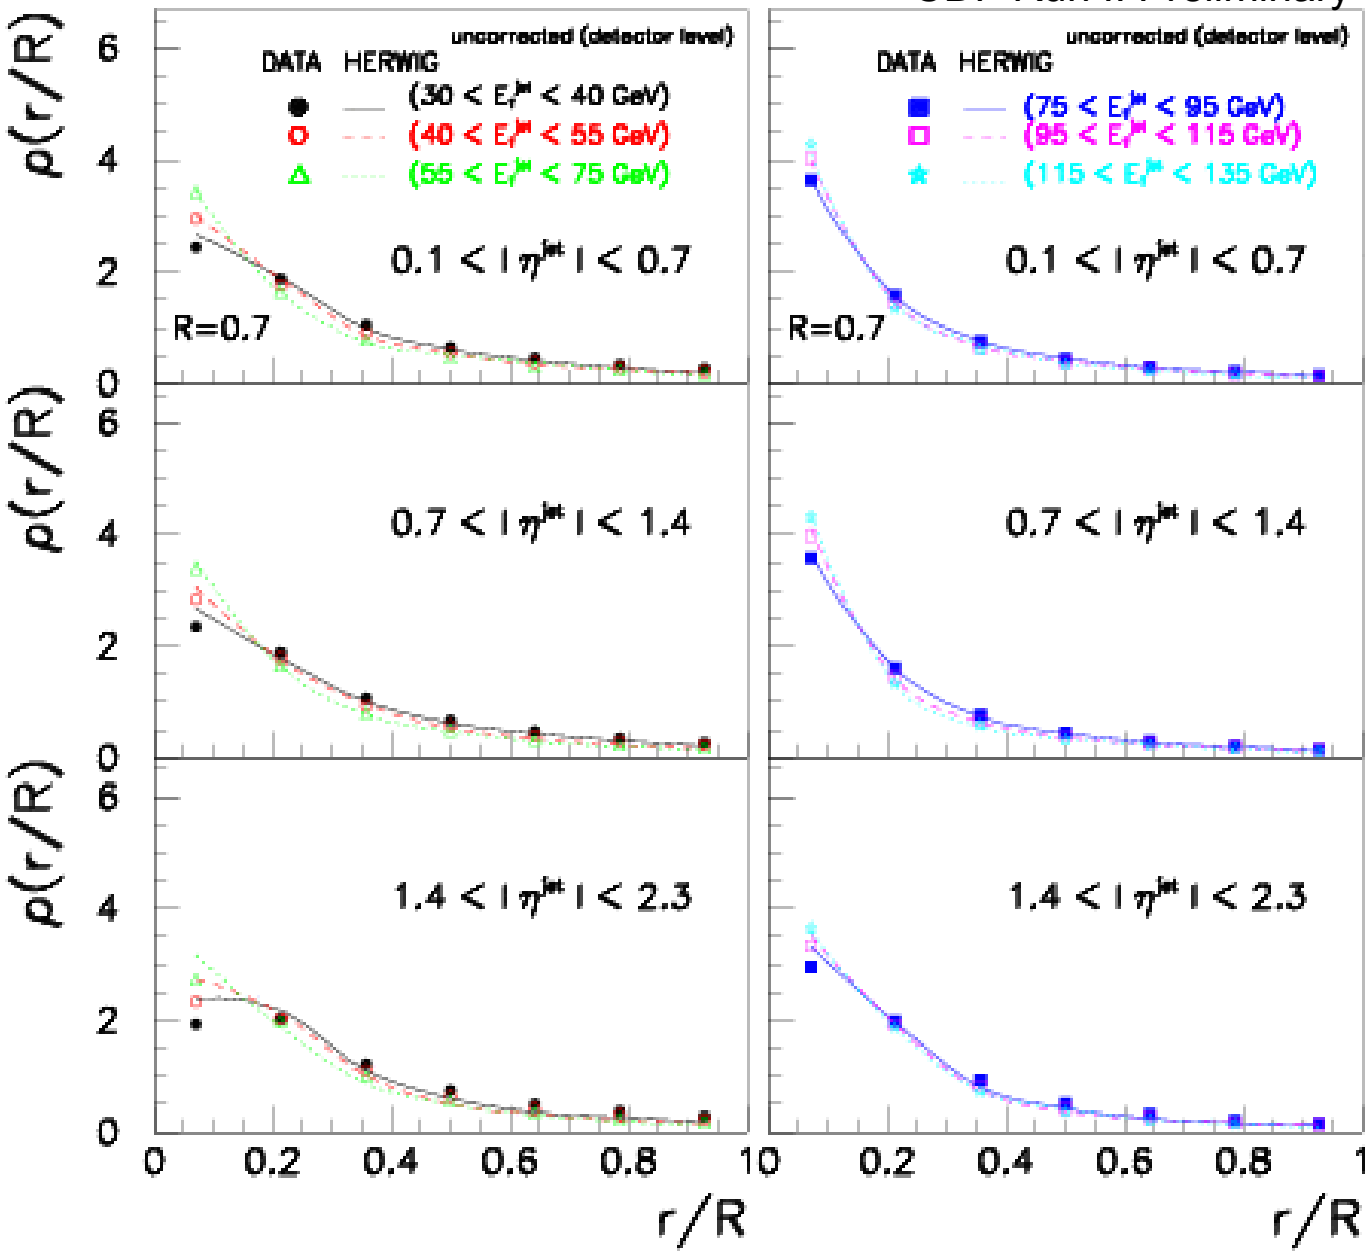
$$\rho(r) = \frac{1}{N_{\text{jets}}} \frac{1}{\Delta r} \Sigma_{\text{jets}} \frac{E_T(r \pm \Delta r/2)}{E_T^{\text{jet}}(0, R)}$$

$$\Sigma_{r=0}^{R} \; \Delta r \cdot \rho(r) = 1$$

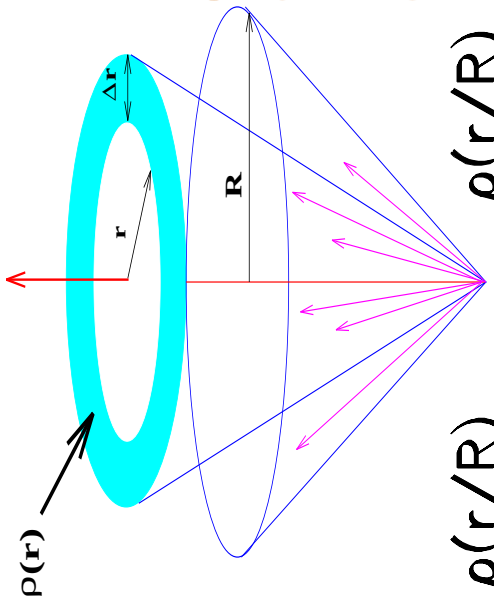
Data & *HERWIG*



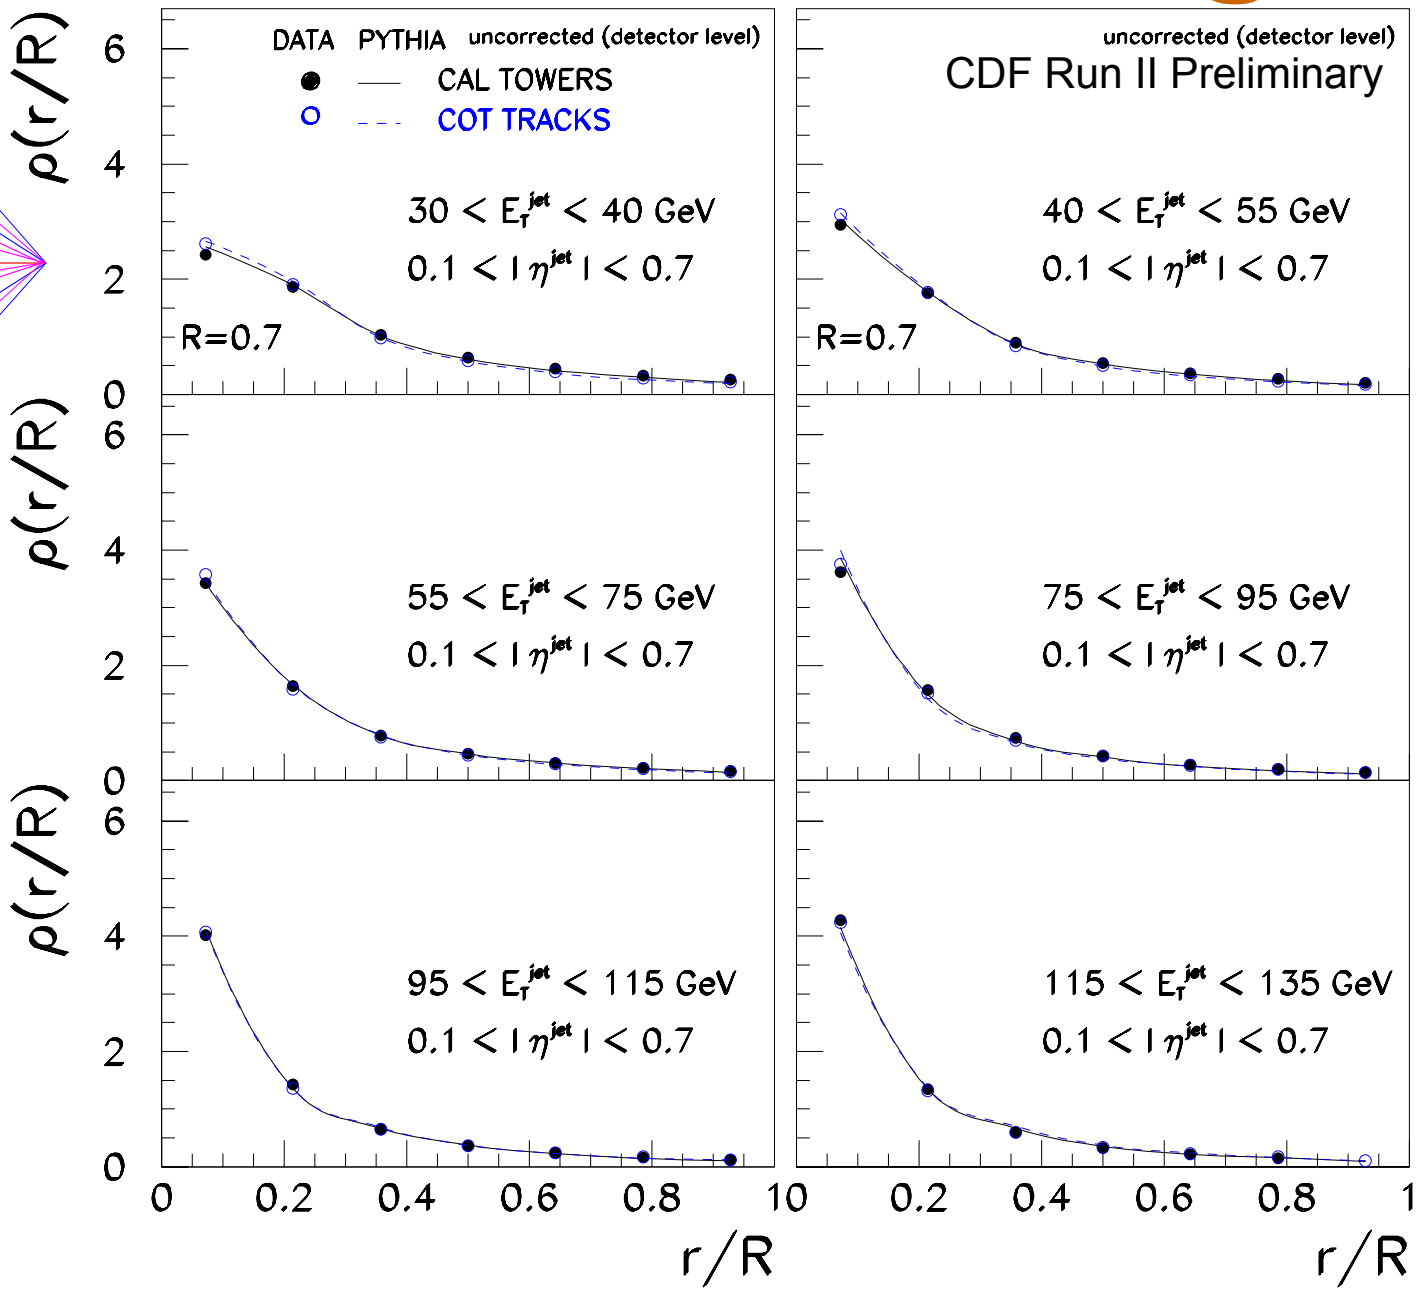
- **Narrower jets at high E_T & low η**
- ***HERWIG* agrees well with data**



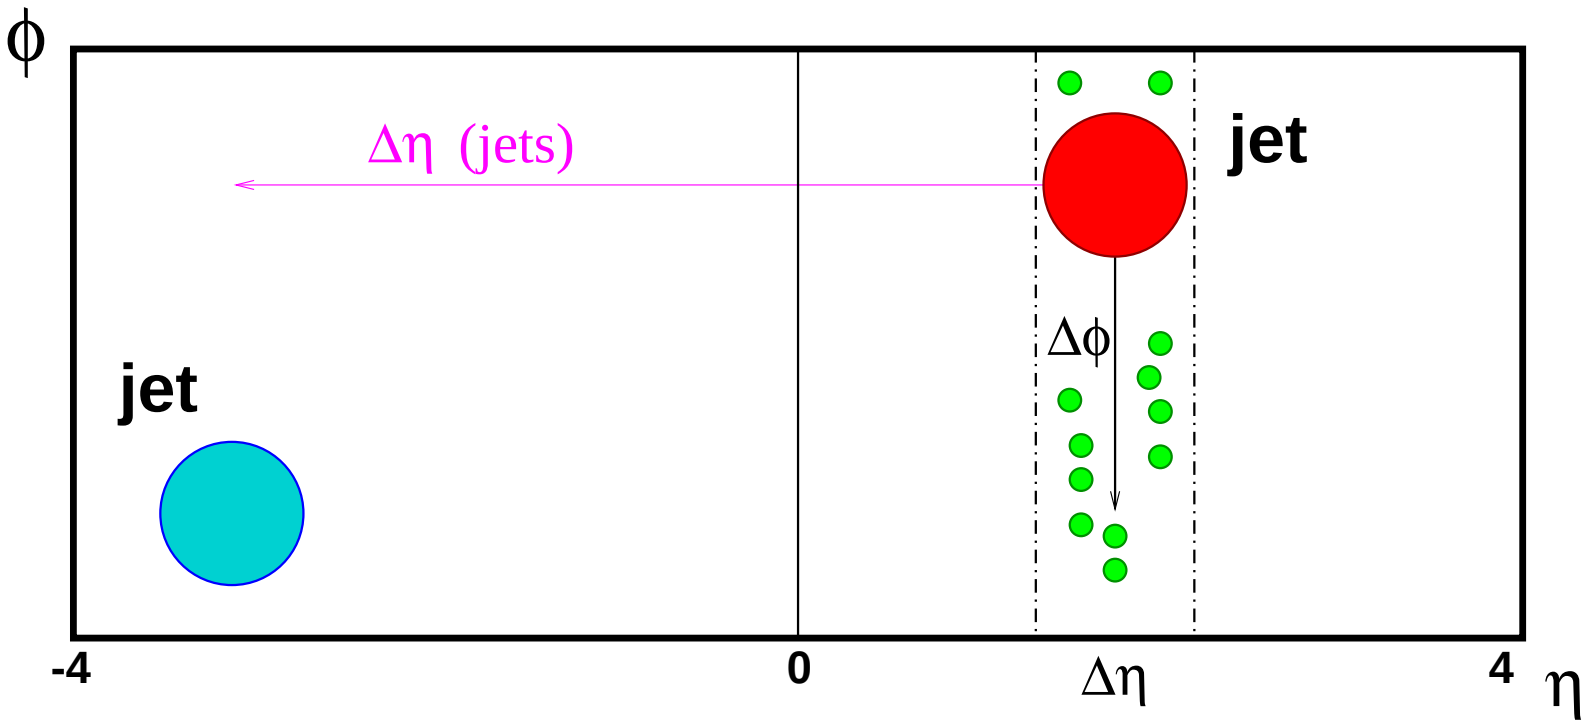
Calorimeter vs. tracking



- Use COT tracks with $p_T > 0.5$ GeV
- Agrees with calorimeter-based shape
- Agrees with *PYTHIA*

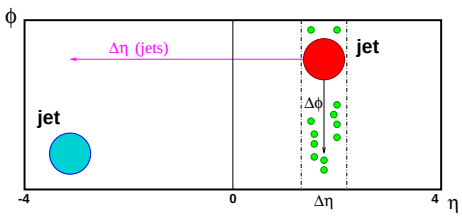


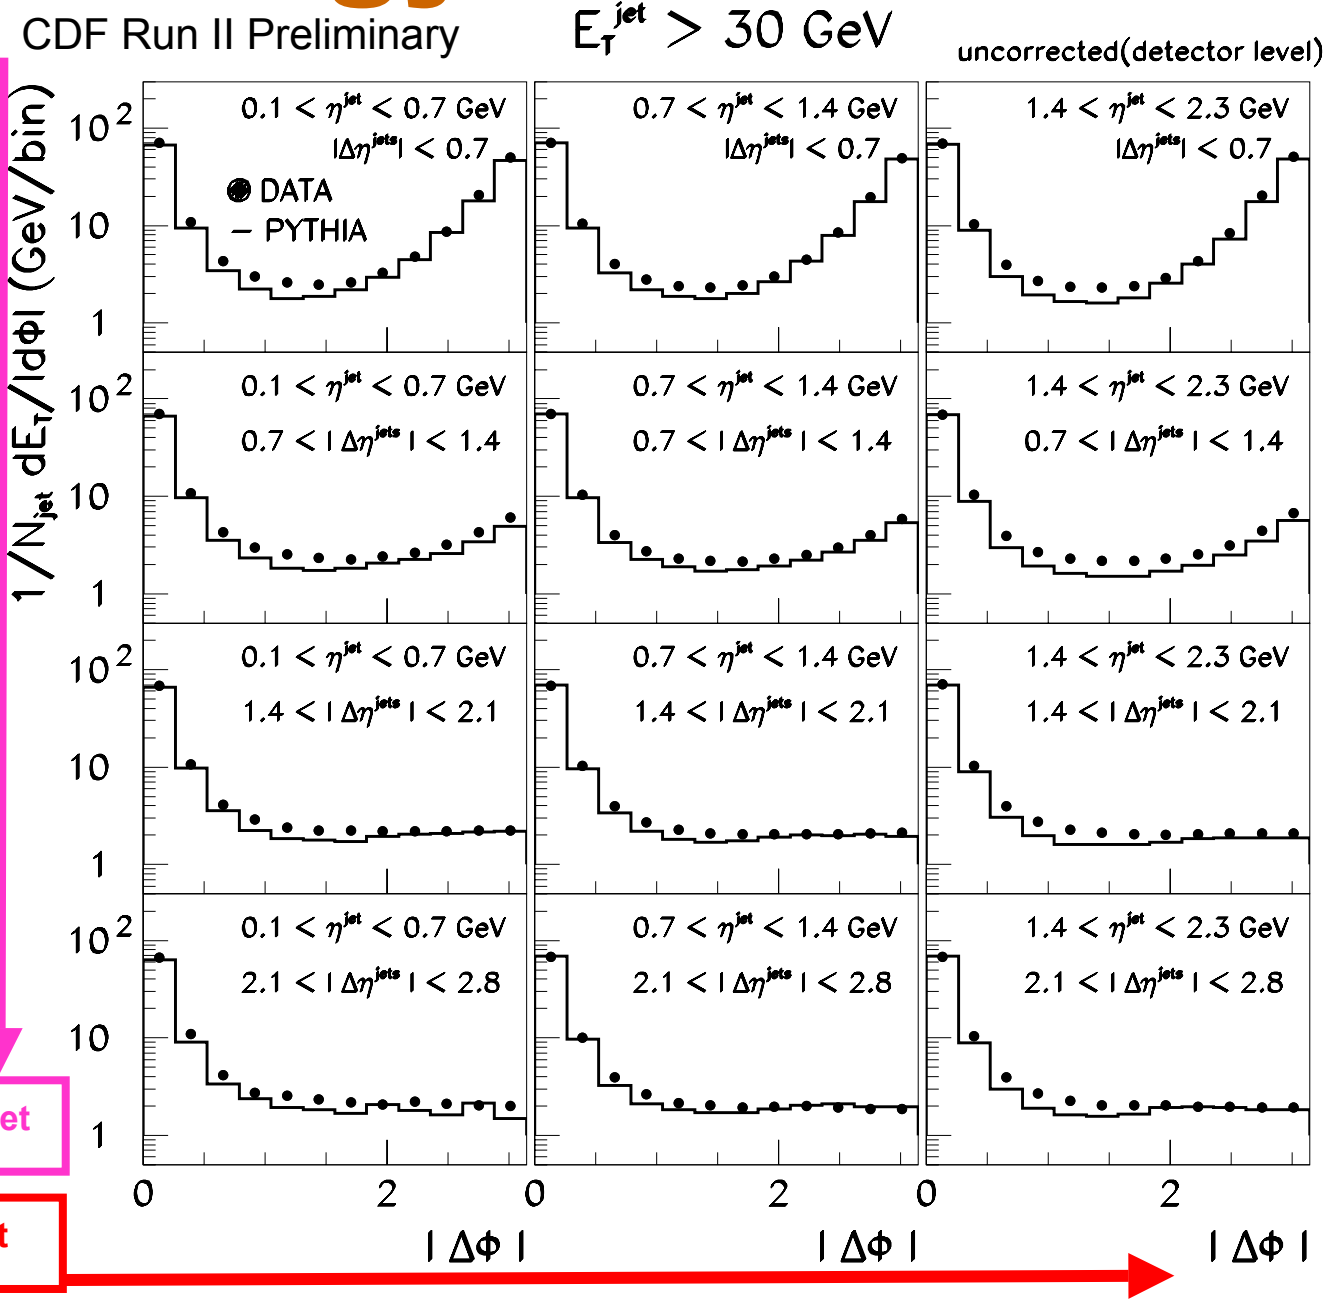
Energy flows



- Look *outside* the jet
- Probe the underlying event

Energy flows





Increasing $\Delta\eta^{jet}$

Increasing η^{jet}

Summary

- CDF has preliminary measurements in Run II
  - Inclusive jet cross section
  - Dijet mass
  - Jet shapes & energy flow
- Higher $\sqrt{s}$ ➔ more jets at high E_T
- Data samples w/ higher statistics than Run I
- Dominant systematic: jet *E*-scale
- General agreement w/ fixed-order QCD calculations & Monte Carlos

Outlook

- Reduced systematics
- More data
- Forward jets
- Different jet algorithms
- Other jet analyses
  - Dijet angular distribution
  - σ(*b*-jet)
