- Introduction
- **TEVATRON** - $p\bar{p}$ - (Production and Spectroscopy)
 - ◆ Collider and fixed target
- **LEP** - e^+e^- - (Production)
- **HERA** - $e^\pm p$ - (Production)
 - ◆ Collider and fixed target

(Inelastic production measurements)
- **KEKB-PEP-II** - e^+e^- - (Production and Spectroscopy)
- Conclusions

Introduction – Heavy Quarkonium

Privileged window into the QCD world.

Multi-scale systems probing all energy regimes of QCD

Renewed interest, puzzles, challenges, discovery of new states.

Many running experiments cross checking each other (e^+e^- machines, ep machines, ppbar machines) and challenging theory. Getting information from photon-photon fusion, photon-gluon fusion, gluon-gluon fusion, etc.). Answers and more challenges are around the corner.

Various theoretical approaches have matured and can cross check each other.

Tevatron Performance

- *Tevatron (Run I 1992-96, $\int L dt = 110 pb^{-1}$):*
 - ◆ *$p \rightarrow \leftarrow pbar$ at $\sqrt{s} = 1.8 TeV$, $3.5 \mu s$ between collisions*
- *Tevatron (Run II 2002-Present, $\int L dt = \sim 430 pb^{-1}$):*
 - ◆ *$p \rightarrow \leftarrow pbar$ at $\sqrt{s} = 1.96 TeV$, $396 ns$ between collisions*

Stores 3245, 3261

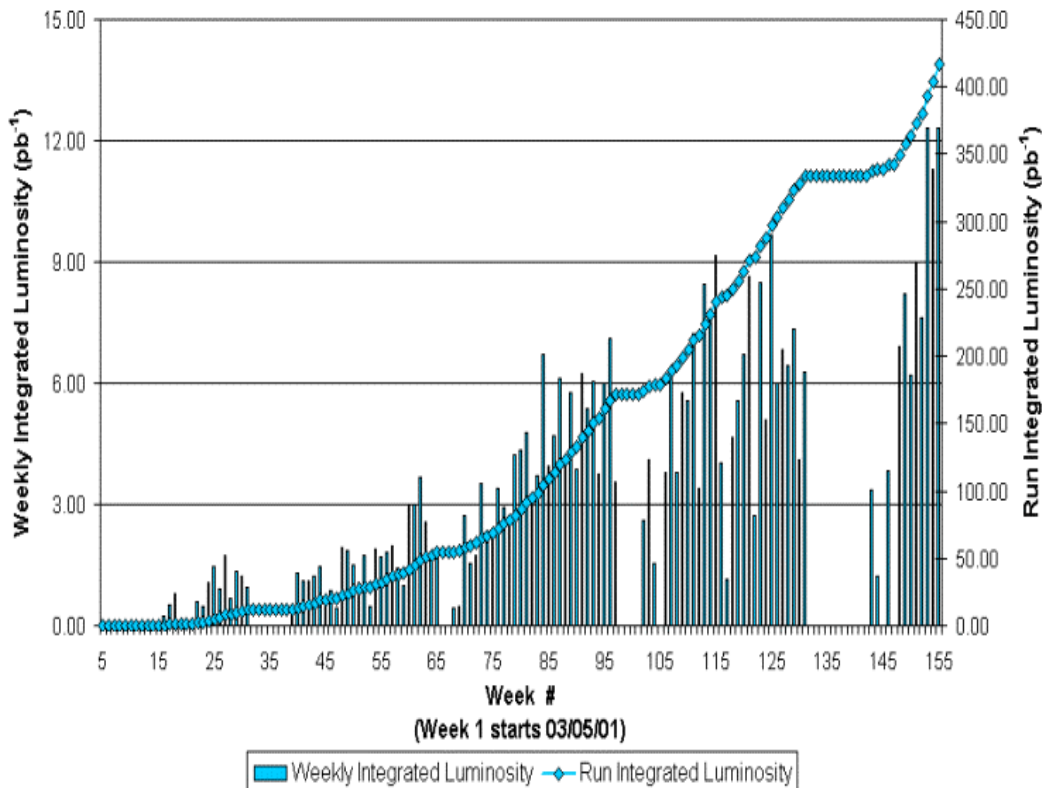

02/18/04, 02/27/04

$6.26, 6.75 \times 10^{31} cm^{-2}s^{-1}$

Duration of 35.3, 41.0 hours

$3.19, 3.94 pb^{-1}$ per experiment

Collider Run II Integrated Luminosity

Collider Run II Peak Luminosity

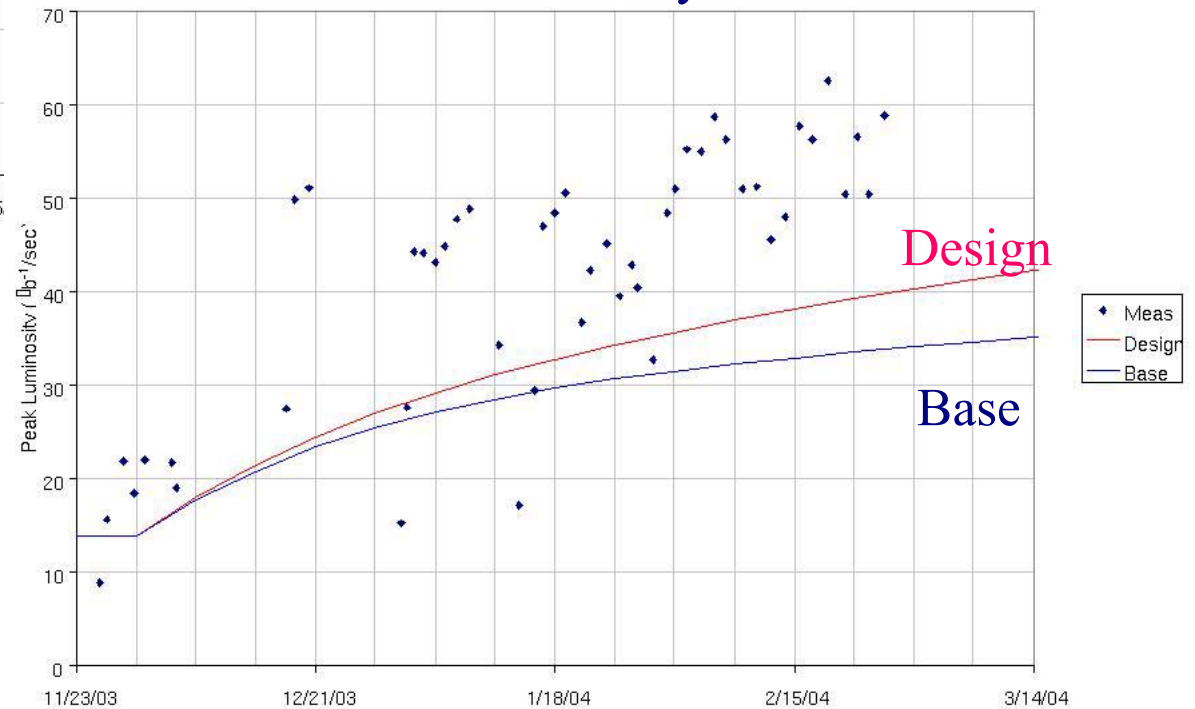

Tevatron Performance

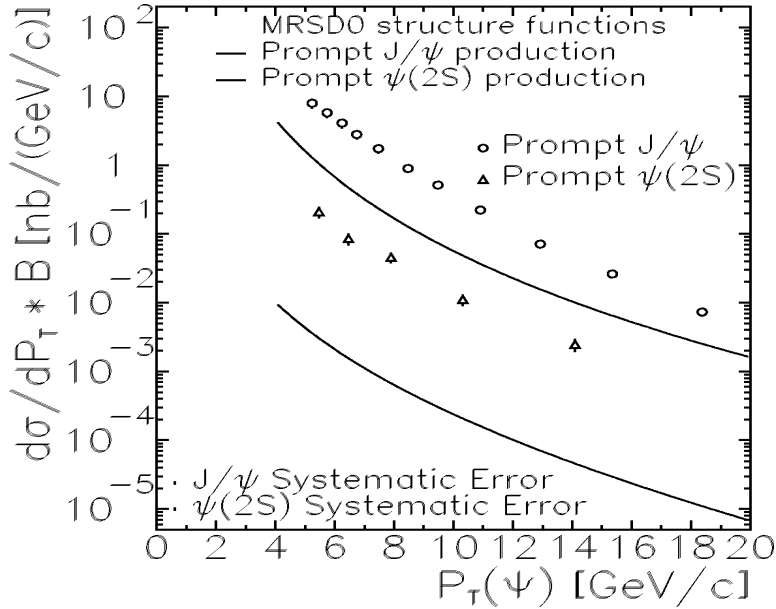

Integrated Luminosity since 11/23/03

Peak Luminosity since 11/23/03

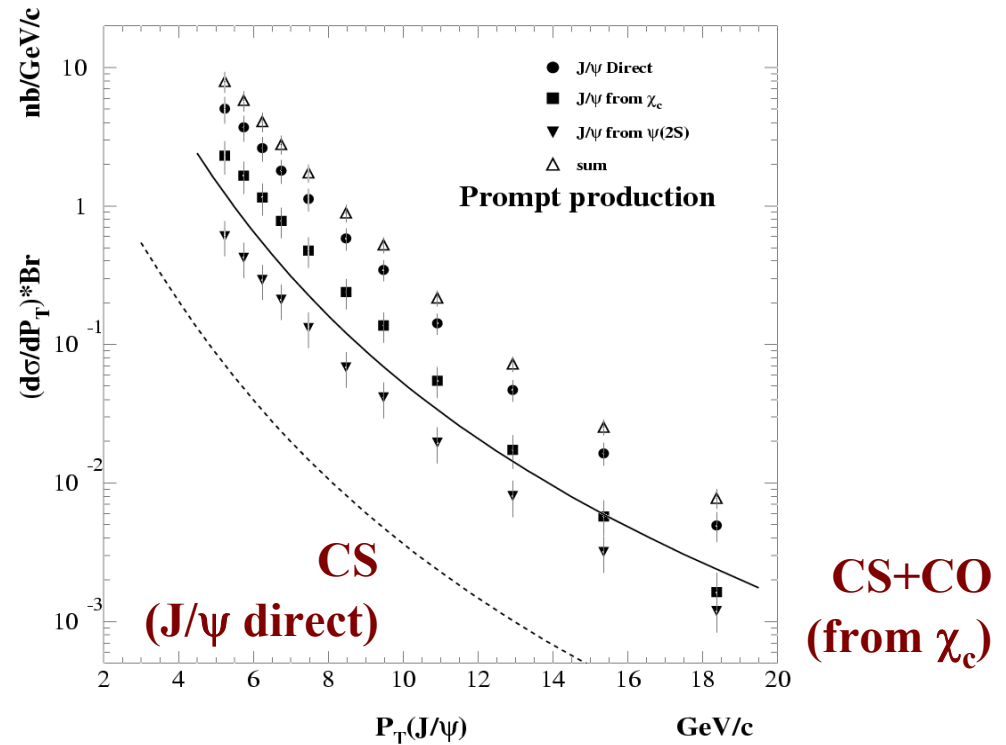

Prompt / Direct J/ψ Cross Section - CDF

J/ψ, ψ(2S) → μμ

- Prompt J/ψ cross section includes
 - ◆ χ_c decays ($\chi_c \rightarrow J/\psi \gamma$ measured)
 - ◆ ψ(2S) feed-down (measured)
 - ◆ Direct J/ψ (64±6%)

CDF, PRL 79(1997) 572, 578

March 3, 2004

Direct $\psi(2S)$ Cross Section - CDF

- $\psi(2S) \rightarrow \mu\mu$, Run IA data, 18 pb^{-1}
- “Central muons” ($|\eta| < 0.6$)
- Lifetime information used to extract prompt component
- *Prompt* \equiv *direct* for $\psi(2S)$
- **Colour singlet fusion**: α_s^3/p_T^8
- **CS fragmentation** (Braaten, Yuan, PRL 71(1993) 1673): α_s^5/p_T^4

$$g^* \rightarrow 2g + c\bar{c}({}^3S_1^{(1)}) \rightarrow \psi(2S)$$

- NRQCD expansion

$$d\sigma(H) = \sum_n d\sigma[c\bar{c}(n)] \langle O^H(n) \rangle$$

- ◆ n includes colour singlet and octet states
- ◆ Expansion in α_s and v (relative velocity of quark and anti-quark)

Beneke, Krämer, PRD 55(1997) 5269

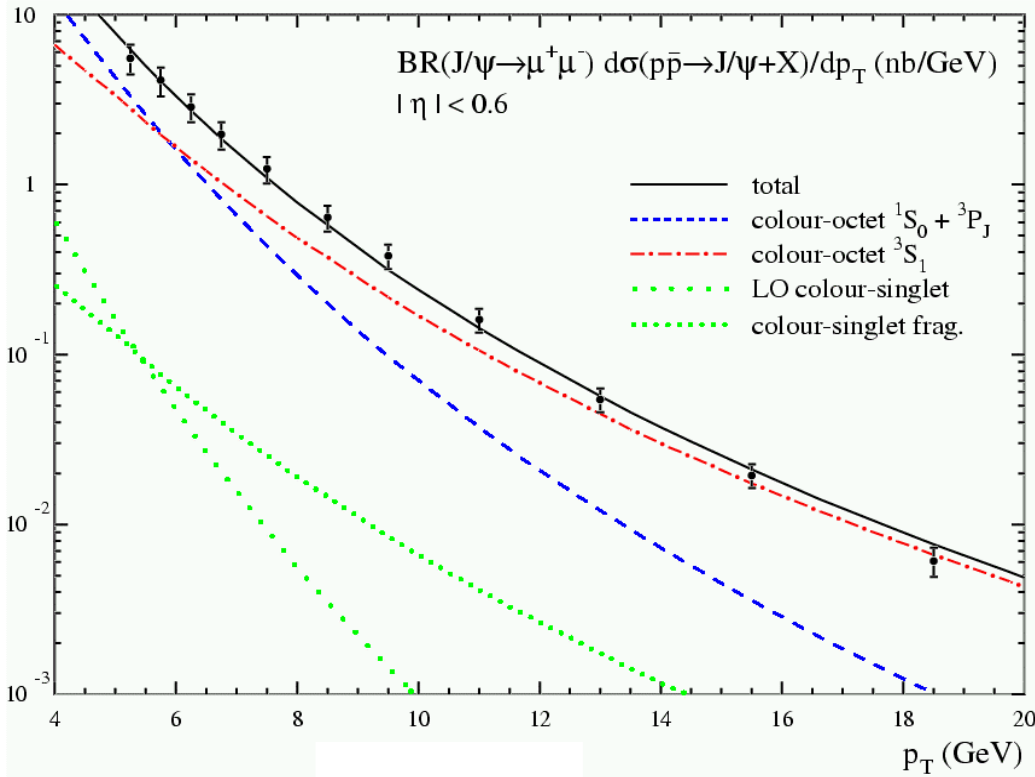

CDF Data: PRL 79(1997) 572

- **Colour octet fragmentation** (Braaten, Fleming, PRL 74(1995) 3327): $\alpha_s^3 v^4 / p_T^4$
- $g^* \rightarrow c\bar{c}({}^3S_1^{(8)}) \rightarrow \psi(2S)$
- *Fragmentation dominates at high p_T*

Direct J/ψ Cross Section - CDF

- Large uncertainties in the extracted matrix elements

- ◆ low p_T : effects of gluon k_t
- ◆ parton density functions

Beneke, Krämer, PRD 55(1997) 5269

Vaia Papadimitriou (Fermilab)

LO colour singlet:

$$+ \dots \quad \sim \alpha_s^3 \frac{(2m_c)^4}{p_t^8}$$

colour-singlet fragmentation: $g + g \rightarrow [c\bar{c}[^3S_1^{(1)}] + gg] + g$

$$+ \dots \quad \sim \alpha_s^5 \frac{1}{p_t^4}$$

colour-octet fragmentation: $g + g \rightarrow c\bar{c}[^3S_1^{(8)}] + g$

$$+ \dots \quad \sim \alpha_s^3 \frac{1}{p_t^4} v^4$$

colour-octet fusion: $g + g \rightarrow c\bar{c}[^1S_0^{(8)}, ^3P_J^{(8)}] + g$

$$+ \dots \quad \sim \alpha_s^3 \frac{(2m_c)^2}{p_t^6} v^4$$

March 3, 2004

LEP2 - DELPHI

- Photoproduction ($\gamma\gamma \rightarrow J/\psi X$) at LEP 617 pb⁻¹ PL B565(2003) 76

Comparison of theory with data clearly favors NRQCD over CSM.

Theory uncertainties mainly from CO ME and renormalization/factorization scales.

Vaia Papadimitriou (Fermilab)

Klasen, Kniehl, Mihaila, Steinhauser PRL 89(2002) 032001

J/ψ Cross Section – Run II (CDF)

$$\sigma_{p\bar{p} \rightarrow J/\psi} = 240 \pm 1(\text{stat})^{+35}_{-28}(\text{syst}) \text{ nb}$$

Cacciari, Frixione, Mangano,
Nason, Ridolfi, hep-ph/0312132

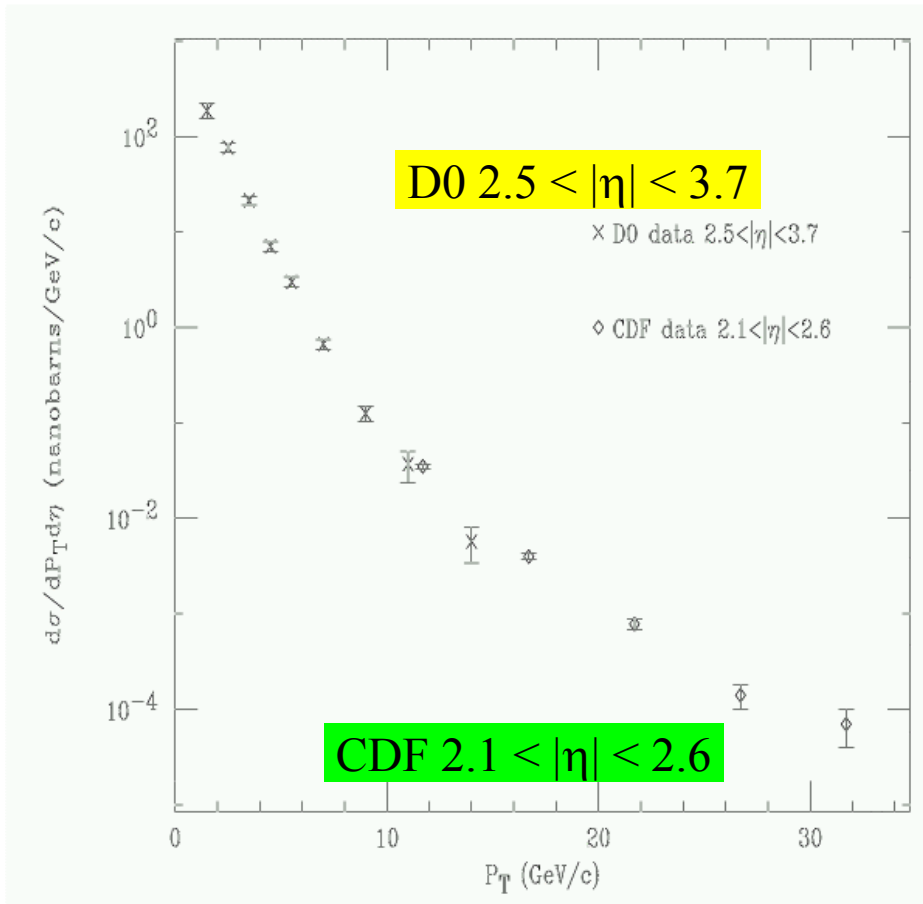

$$\sigma(p\bar{p} \rightarrow H_b X, |y| < 0.6) \text{Br}(H_b \rightarrow J/\psi X) \text{Br}(J/\psi \rightarrow \mu\mu) =$$

$$24.5 \pm 0.5(\text{stat}) \pm 4.7(\text{syst}) \text{ nb}$$

Central-Forward J/ψ Production (CDF/D0)

CDF: PRD 66(2002)092001

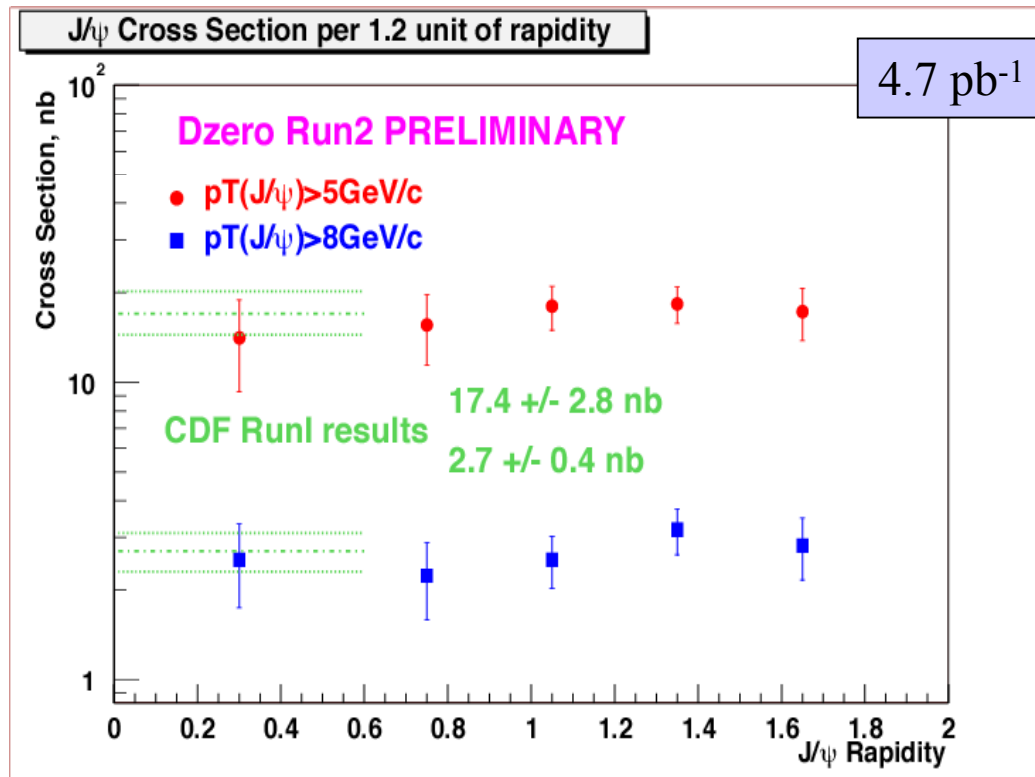

D0: PRL 82(1999)35

Reasonable agreement between central and forward measurements

CDF Run II: low p_T muon coverage ($|\eta| < 1.5$)

J/ψ Cross Section - Run II

Cross section as a function of rapidity

Υ Cross Section at CDF

Run I:
PRL 88 (2002)161802

- smaller discrepancy with CSM but similar to $c\bar{c}$ result
- NRQCD CS+CO terms able to fit data with $p_T > 8$ GeV/c

χ_b Feed-down to $\Upsilon(1S)$ at CDF

Run I:

PRL 84 (2000) 2094

➤ $\chi_b(1P, 2P) \rightarrow \Upsilon(1S)\gamma$

➤ $p_T(\Upsilon) > 8 \text{ GeV}/c$

➤ γ backgrounds: π^0 , η , K_S decays

Direct $\Upsilon(1S)$: $(50.9 \pm 8.2 \pm 9.0)\%$

From $\chi_b(1P)$: $(27.1 \pm 6.9 \pm 4.4)\%$

From $\chi_b(2P)$: $(10.5 \pm 4.4 \pm 1.4)\%$

From $\Upsilon(2S)$: $(10.7^{+7.7}_{-4.8})\%$

From $\Upsilon(3S)$: $(0.8^{+0.6}_{-0.4})\%$

Input in theoretical calculations of
Bottomonium cross sections

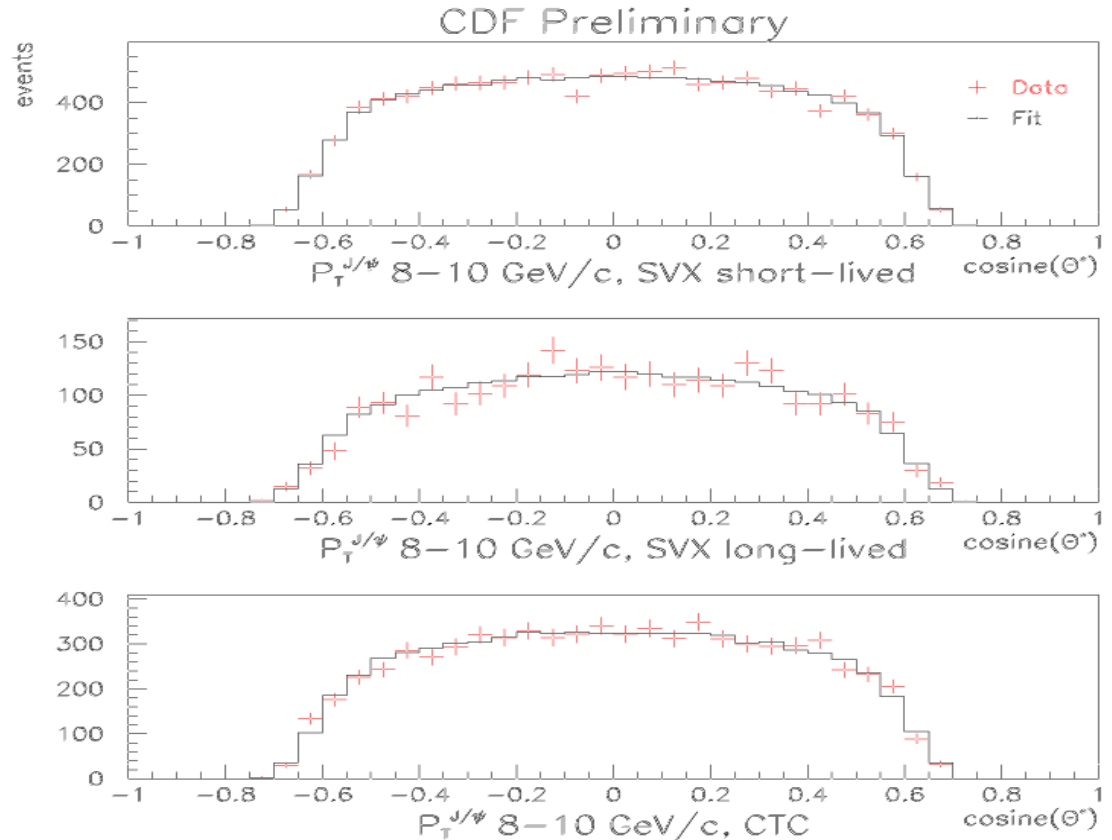

J/ψ Polarization

- All CDF Run I data, $\int \mathcal{L} dt = 110 \text{ pb}^{-1}$
- $p_T > 4 \text{ GeV}$, $|y| < 0.6$
- Small acceptance at large $|\cos \theta|$
- χ^2 fit using templates for longitudinal and transverse polarization

$$d\Gamma / d \cos \theta \propto 1 + \alpha \cos^2 \theta$$

$$\alpha = 1 \quad \text{transverse}$$

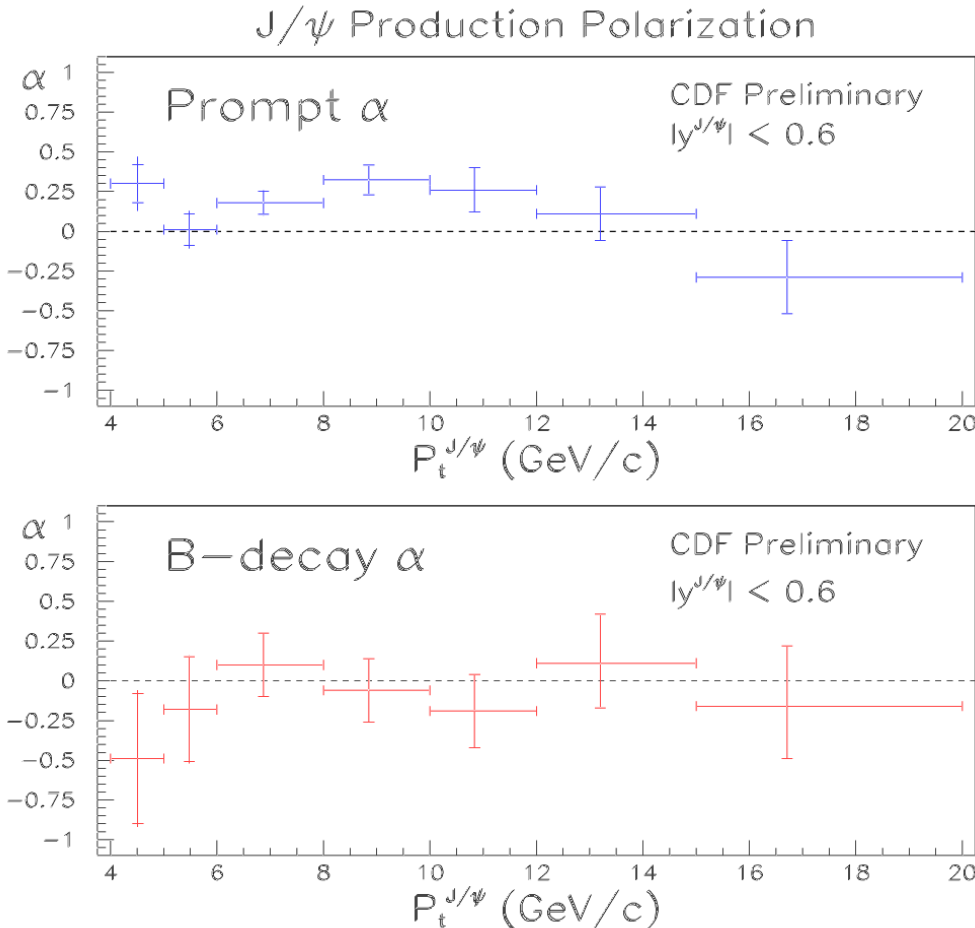

$$\alpha = -1 \quad \text{longitudinal}$$

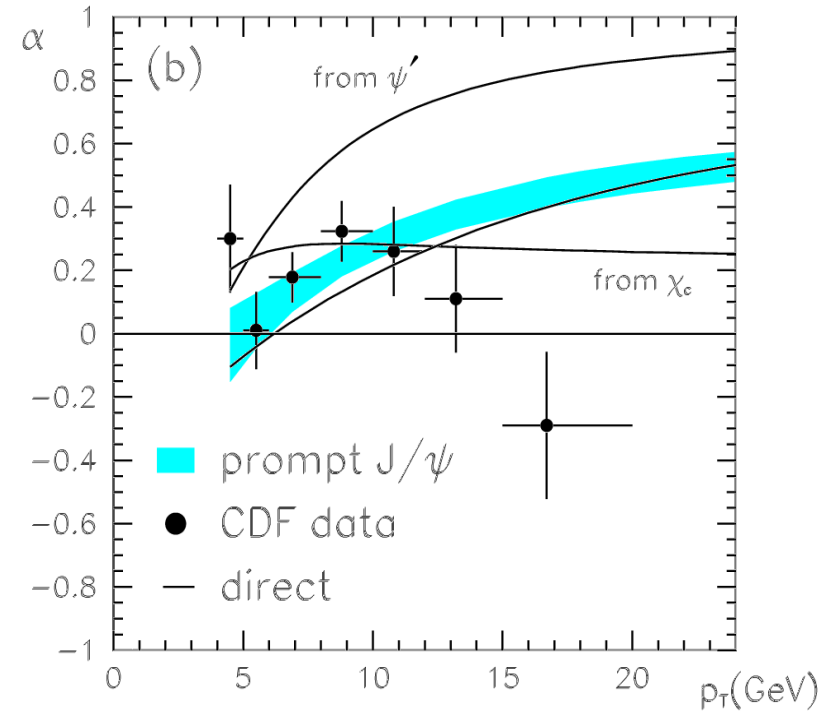

J/ψ Polarization

CDF, PRL 85 (2000) 2886

Braaten, Kniehl, Lee
PRD 62 (2000) 094005

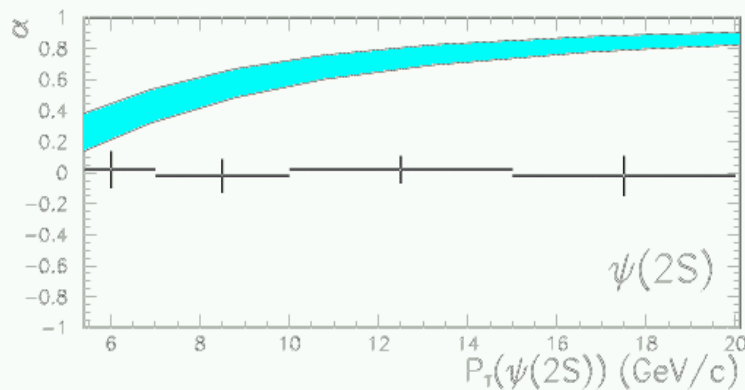

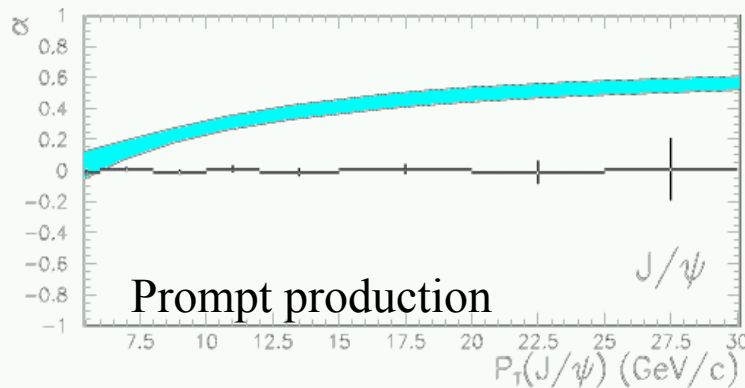

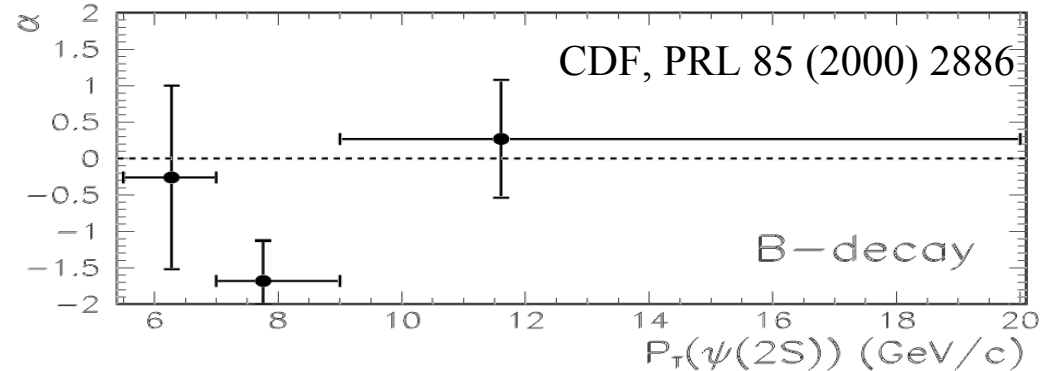

J/ψ from B decays
essentially unpolarized

- Need to take into account $\psi(2S)$ and χ_c contributions
- Data do not show a trend towards transverse polarization at large p_T
- Phenomenological models give better description (E.g. **colour evaporation model**: mostly unpolarized J/ψ at large p_T)

$\psi(2S)$ Polarization

- Same procedure, limited statistics
- Preferable to J/ψ since no **contamination** from indirect production
- Inconclusive

CDF study :

- Assume factor 50 in effective statistics
 - ◆ 2 fb^{-1} , better Silicon coverage
- Lower dimuon trigger threshold (1.5GeV)
 - ◆ Able to measure down to $p_T(J/\psi)$ of ≈ 0

Υ Polarization at CDF

Run I:
PRL 88 (2002)161802

$$|y| < 0.4$$
$$8 < p_T < 20 \text{ GeV}/c$$

$$1 + \alpha \cos^2\theta$$
$$\alpha = -0.12 \pm 0.22$$

- similar to $c\bar{c} \rightarrow$ as yet inconclusive
- Insufficient data with $p_T > 20 \text{ GeV}/c$

E866/Nusea, $\sqrt{s}=38.8$ GeV

$p + \text{Cu} \rightarrow \mu^+ \mu^- X$
(800 GeV proton beam)

$0 < x_F < 0.6$

$p_T < 4$ GeV/c
(transverse to beam axis)

- $\Upsilon(2S)$ and $\Upsilon(3S)$ not distinguished
- Subtract Drell-Yan $\mu\mu$ continuum (100% transverse polarization)
- sideband fit: $\alpha = 1.008 \pm 0.016 \pm 0.020$

E866/Nusea, Υ polarization

$\cos\theta$ distributions for $p_T > 1.8$ GeV/c

o inclusive $\Upsilon(1S)$:

NRQCD: $\alpha = 0.28$ to 0.31 , avg over p_T, x_F
Observed: $\alpha = 0.07 \pm 0.04(\text{stat}) \pm 0.06(\text{sys})$

o inclusive $\Upsilon(2S) + \Upsilon(3S)$:

No explicit **NRQCD** prediction

Large **observed** transverse polarization, **in contrast with charmonium**

Run II – (CDF/D0 on χ_c)

CDF - Run I

PRL 79 (1997) 578
PRL 86 (2001) 4472

γ conversions

CDF Run II

D0 Run II Preliminary

γ conversions

$$\sigma_{\chi_{c2}}/\sigma_{\chi_{c1}} = 0.96 \pm 0.27(\text{stat}) \pm 0.11(\text{sys}) \text{ (CDF)}$$

F. Maltoni (NRQCD prediction), 1.1 ± 0.2

March 3, 20u4

Tevatron/Fixed Target Summary

- Tevatron:

- ◆ Direct J/ψ and $\psi(2S)$ production (CDF) is in excess of CSM predictions by a factor of ~ 50
- ◆ J/ψ cross section in the $(2.5 < |\eta^{J/\psi}| < 3.7)$ range (D0) consistent with CDF data for central J/ψ production
- ◆ New cross sections, at low p_T , available. Need more theory calculations
- ◆ J/ψ and $\psi(2S)$ polarization measurements (CDF) appear not to support the COM prediction (more statistics needed)
- ◆ $\sigma_{\chi_{c2}}/\sigma_{\chi_{c1}} = 0.96 \pm 0.27(\text{stat}) \pm 0.11(\text{sys})$ (CDF); NRQCD prediction: 1.1 ± 0.2
- ◆ Same shape for $d\sigma/dp_T$ vs p_T for 3 $Y(n)$ states. Fits of CS and CO matrix elements describe the $Y(n)$ cross sections (CDF)
- ◆ $Y(1S)$ polarization: $\Gamma_L/\Gamma = 0.39 \pm 0.11$ ($\alpha = -0.12 \pm 0.22$) (CDF) consistent with COM calculations
- ◆ Results on production of $Y(1S)$ from χ_b decays
 $Y(1S)$ direct production: $[50.9 \pm 8.2(\text{stat}) \pm 9.0(\text{sys})]$ % (CDF)
- ◆ Diffractive to total production rate for $|\eta| < 1$ is $[1.45 \pm 0.25]\%$ (CDF)

Tevatron/Fixed Target Summary

- Fixed Target energies:
 - ◆ Y(1S): significant positive transverse production polarization for either $p_T > 1.8 \text{ GeV}/c$ or $x_F > 0.35$ (E866)
 - ◆ Y(2S+3S) (unresolved): large transverse production polarization at all measured p_T and x_F (E866)

Quarkonia at HERA

HERA (“Run I” ended in September 2000, $\int L dt > 100 \text{ pb}^{-1}$):

◆ $e^\pm (27.5 \text{ GeV}) \rightarrow \leftarrow p (820/920 \text{ GeV})$ at $\sqrt{s} = 300/320 \text{ GeV}$

$$Q^2 := -q^2$$

$$W^2 := (p_p + q)^2 \approx Q^2 / x$$

$$Q^2 := \approx xys$$

Vaia Papadimitriou (Fermilab)

- DIS
 - ◆ $1 < Q^2 < 100 \text{ GeV}^2$
- Tagged/untagged photoproduction
 - ◆ Scattered e not seen in main detector
 - ◆ Median $Q^2 \cong 10^{-4} \text{ GeV}^2$
- Decays into e^+e^- and $\mu^+\mu^-$
- Central tracking ($|\eta| < 1.8$)
 - ◆ $30 < W < 180 \text{ GeV}$

HERA “Run II” under way;

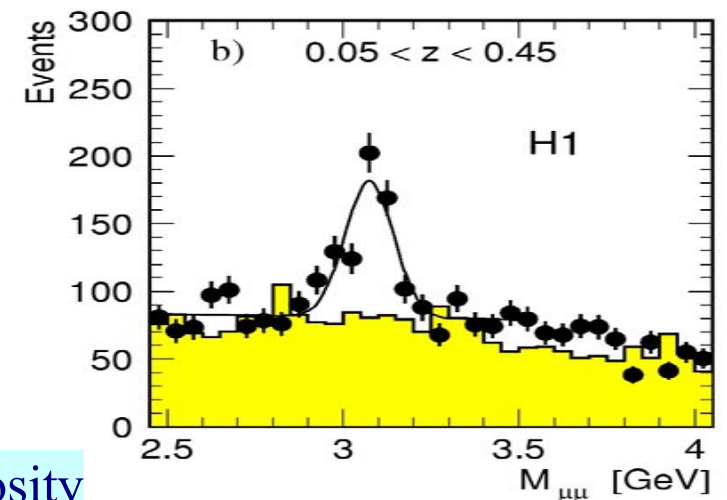

*Delivered $\sim \int L dt = 22 \text{ pb}^{-1}$ so far. Achieved up to $0.8 \text{ pb}^{-1}/\text{day}$.
 $\int L dt \sim 100 \text{ pb}^{-1}$ expected by the Sept. 2004); e^\pm polarized beams.*

J/ψ at HERA

$$Z = \frac{P_p \cdot P_\psi}{P_p \cdot P_\gamma} = \frac{E_\psi}{E_\gamma} \quad \text{in p rest frame}$$

- Order of magnitude comparable
 - ◆ “Elastic” $z \approx 1 (M_X = m_p)$
 - ◆ p diffractive dissociation $z \approx 1 (\sigma \propto 1/M_X^2)$
 - ◆ “Inelastic” $z < 1$
- At small z contributions from
 - ◆ Resolved photon
 - ◆ B production
- Background increases with decreasing z

High Q^2/p_T will greatly benefit from increase in luminosity

J/ψ Photoproduction: CSM

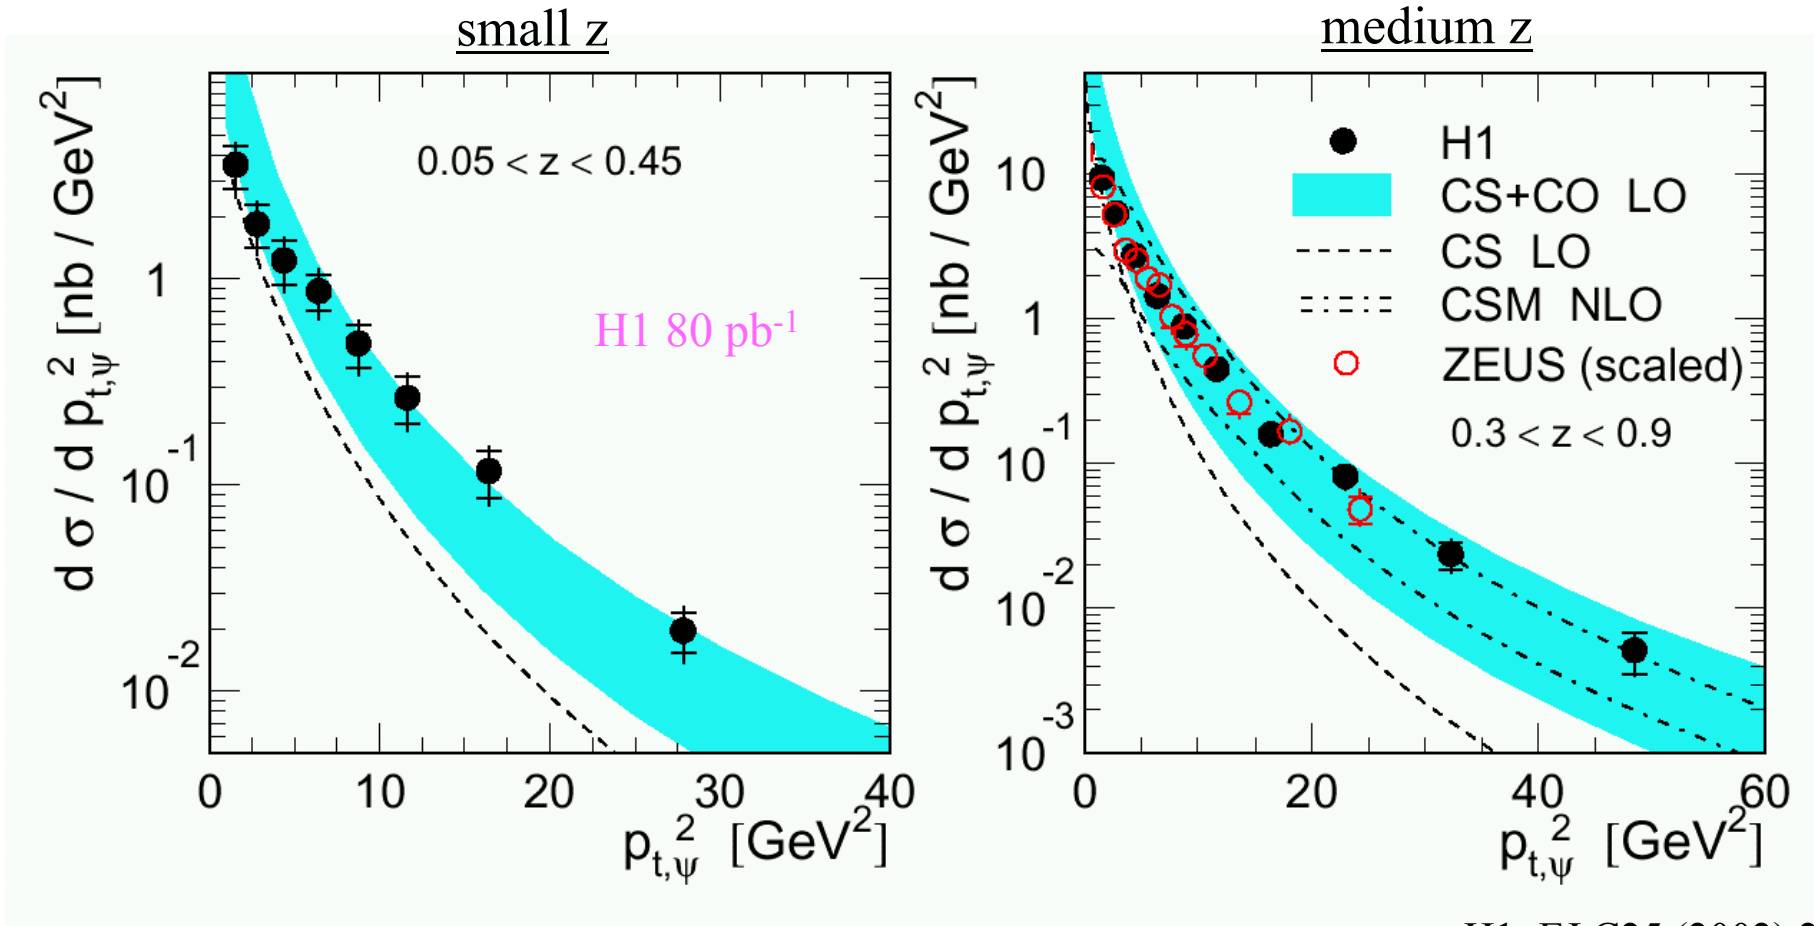

Errorbands: $1.3 \leq m_c \leq 1.5 \text{ GeV}$
 $0.1175 \leq \alpha_s(M_Z) \leq 0.1225$

Colour Singlet Model: NLO
 calculation of direct photon gluon
 fusion process (M.Krämer)

LO: too steep
NLO: good agreement

H1: EJ C25 (2002) 25
 Zeus: EJ C27 (2002) 173

J/ψ Photoproduction: NRQCD

- p_T spectra similar at low and medium z
- NRQCD (including CS and CO): softer than data
- ◆ Contributions from B decays in data?

H1: EJ C25 (2002) 25
Zeus: EJ C27 (2002) 173

J/ψ Photoproduction: inelasticity

EJ C25 (2002) 25
EJ C27 (2003) 173

CO long-distance ME taken
from fit to CDF data

NLO CSM agrees with data; Theoretical uncertainties do not allow strong conclusions on CO

Left: NRQCD describes shapes (large LDME uncertainties)

Right: Damping at high z for BSW (LO, CS+CO) \Rightarrow better agreement

Photoproduction: $\sigma_{\psi(2S)} / \sigma_{\psi(1S)}$

EJ C27 (2003) 173

ZEUS

$$\sigma_{\psi(2S)} / \sigma_{\psi(1S)} = 0.33 \pm 0.10^{+0.01}_{-0.02}$$

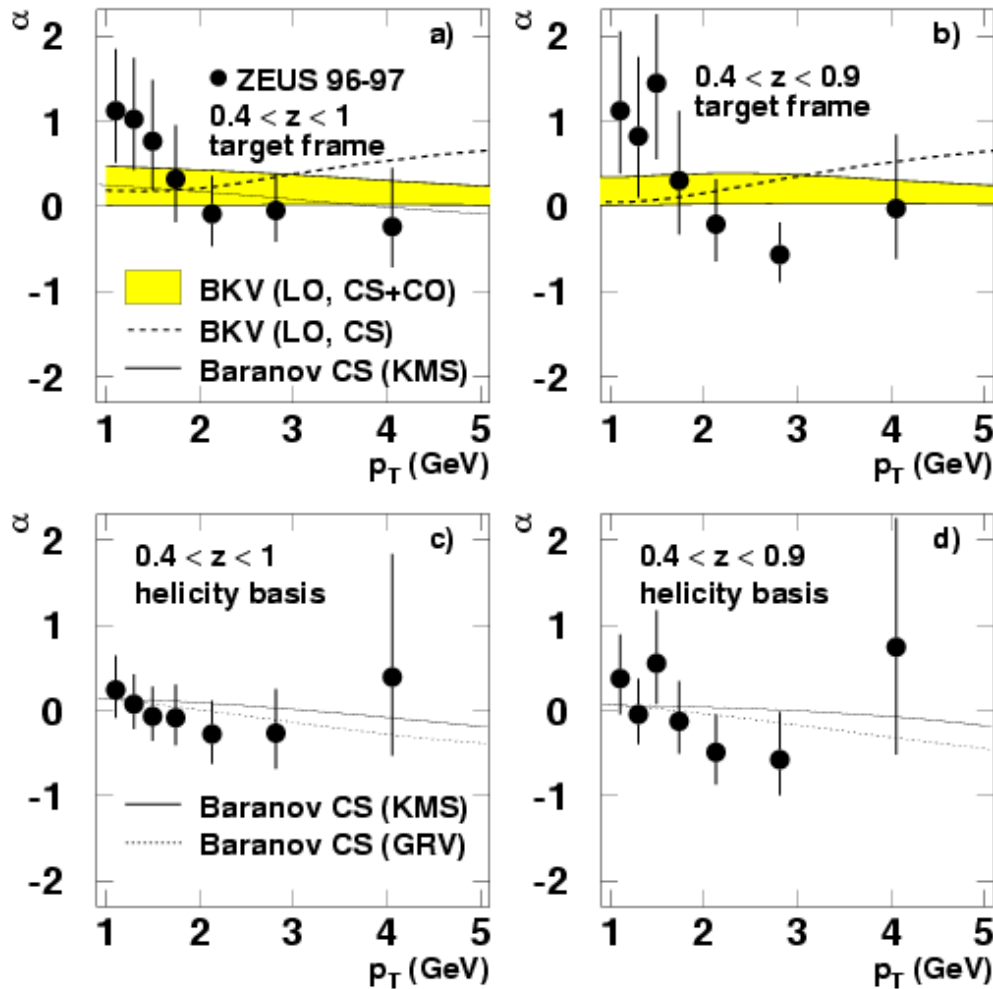

Flat, consistent with 0.24 from KZSZ (LO,CS)

Estimate of J/ψ fraction coming from $\psi(2S)$
Cascade decays consistent with expectations
(15%)

Photoproduction: helicity

EJ C27 (2003) 173

ZEUS

$$dN/d\cos\theta^* \propto 1 + \alpha \cos^2\theta^*$$

BKV – collinear calculations

Baranov – k_t -factorization

Statistics is not yet sufficient to discriminate between models

H1 - J/ψ Electroproduction

Data: $2 < Q^2 < 100 \text{ GeV}^2$

EJ C25 (2002) 41

$0.3 < z < 0.9$

$50 < W < 225 \text{ GeV}$

$p_T^* > 1 \text{ GeV}$

$\int L dt = 77 \text{ pb}^{-1}$

Theory: LO Colour Singlet Model

LO NRQCD (CS+CO)

(B.A.Kniehl, L.Zwirner, NP B621(2002) 337)

CS alone: normalization low, too steep in p_T

NRQCD (CS+CO): too high at low Q^2 , p_T
better at high Q^2 , p_T

Need: NLO calculations

More data at larger Q^2 , p_T

Zeus - J/ψ Electroproduction: Q^2 and W

- KZ(CS) and LZ(CS): lower but consistent with data
- KZ(CS+CO): mostly overshoots data
- LZ(kt, CS): agrees with data

H1 - J/ψ Electroproduction

$Q^2 > 2 \text{ GeV}^2$

Note: Theory normalized to data

Large shape discrepancy

EJ C25 (2002) 41

Rapidity in γp
CMS

HERA photo/electro production summary

- Photoproduction

- ◆ **NLO** corrections enable one to describe high production of J/ψ within **CSM**
- ◆ Theoretical uncertainties are large: **CO** contributions cannot be excluded

- Electroproduction

- ◆ **LO CS**: Below but consistent with data, except high p_T range (**NLO** corrections?)
- ◆ **NRQCD (CS+CO)**: too high at large z and small p_T^* values
- ◆ **kt-factorization (CS)**: agrees with data except at high p_T^* (too low) and in photon direction (too high)

HERA-B

Data taking of 30 October 2002 - 3 March 2003 provided:

- ◆ ~ 300,000 triggered J/ ψ ($e^+e^-/\mu^+\mu^-$)
- ◆ ~ $210 \cdot 10^6$ Minimum bias events

Charmonium Production : χ_c

Fraction of J/ψ produced via χ_c

$$\Delta M = M(J/\psi \gamma) - M(J/\psi)$$

$$R_{\chi_c} = \frac{\sum \sigma(\chi_{ci}) \text{Br}(\chi_{ci} \rightarrow J/\psi \gamma)}{\sigma(J/\psi)_{\text{tot}}}$$

Only μ -channel, 2002/2003 data

$\sim 1300 \chi_c$ in 15% of data

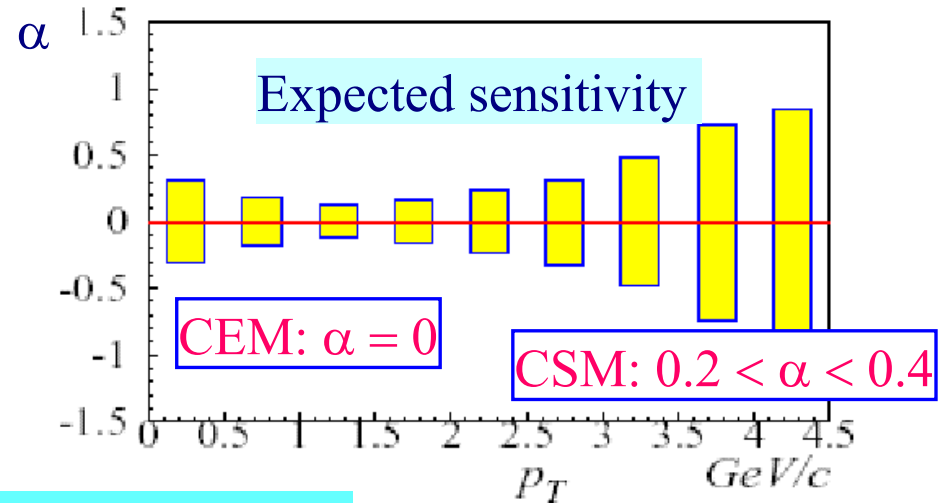

$$R_{\chi_c} = 0.21 \pm 0.05_{\text{stat}}$$

Electron channel gives compatible result.

Measurement 2000 based on $380 \pm 74 \chi_c$ (both $\mu^+\mu^-$, e^+e^-)

$$R_{\chi_c} = 0.32 \pm 0.06_{\text{stat}} \pm 0.04_{\text{sys}}$$

$\psi(2S)$ to J/ψ ratio and J/ψ polarization

Use $\sigma(J/\psi) = 357 \pm 8_{stat} \pm 27_{sys}$ (E771, E789)

$\sigma(\psi(2S)) = 46 \pm 12$ nb/N

$R = \sigma(\psi(2S))/\sigma(J/\psi) = 0.13 \pm 0.02$

Vaia Papadimitriou (Fermilab)

$d\Gamma / d\cos\theta \propto 1 + \alpha \cos^2\theta$

$\alpha = 1$ *transverse*

$\alpha = -1$ *longitudinal*

Conclusions

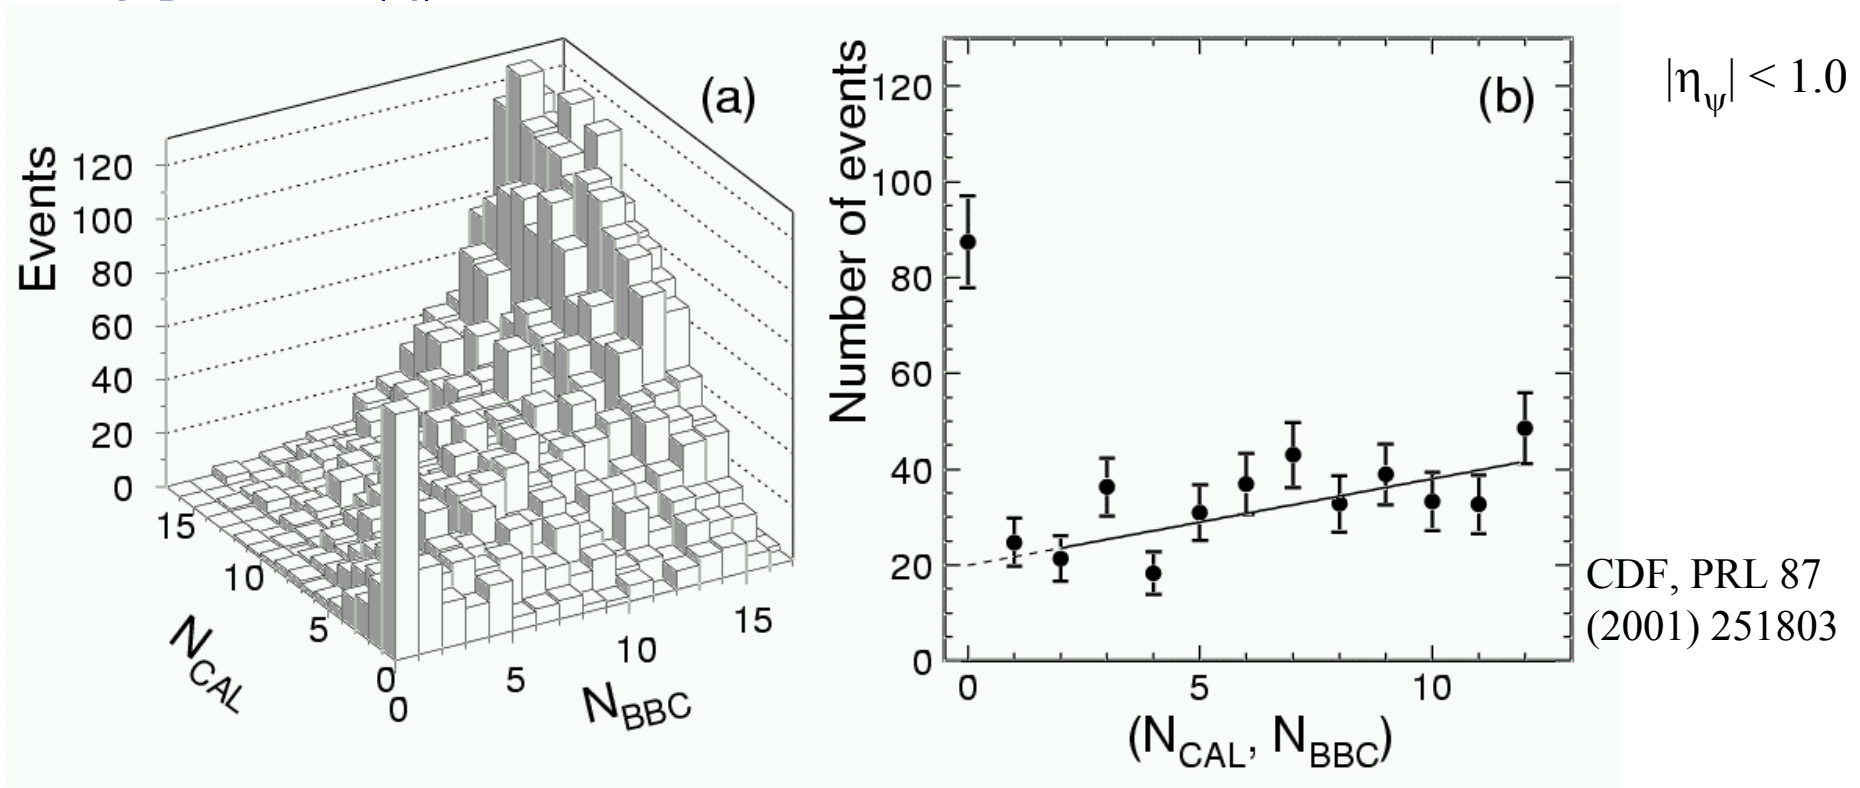

- Lots of results, many surprises
- Very fruitful interaction between theory and experiment
- Tevatron Run II expected to provide (4.4-8.5) fb⁻¹ by October 2009
- HERA-II expected to deliver 0.75 fb⁻¹ equally distributed over charges and helicities by end of 2007. Particular effort will be made to reach 1 fb⁻¹
- BELLE is expected to have 500 fb⁻¹ by the end of 2006; 1 ab⁻¹ by the end of 2008 (~1B BBbar pairs)
- BABAR is expected to have 500 fb⁻¹ by the end of 2006
- A lot of answers and surprises awaiting!!

$$\sigma_{p\bar{p} \rightarrow J/\psi} = 240 \pm 1(\text{stat})_{-28}^{+35}(\text{syst}) \text{ nb}$$

$$\sigma(p\bar{p} \rightarrow H_b X, |y|<0.6) Br(H_b \rightarrow J/\psi X) Br(J/\psi \rightarrow \mu\mu) =$$

$$24.5 \pm 0.5(\text{stat}) \pm 4.7(\text{syst}) \text{ nb}$$

HERA Production Mechanisms

Inelastic

“resolved” (gg-fusion) ($z < 0.3$) direct (γg -fusion) ($z > 0.3$)

J/ψ from $\psi(2S)$ decays ($\psi(2S) \rightarrow J/\psi \pi \pi$ and others)
(not subtracted, measured, $\sim 15\%$)

J/ψ from χ_c decays (not subtracted)
(1% of inelastic, up to 7% at lowest z)

J/ψ from B decays (not subtracted)
(5% of inelastic, up to 25% at lowest z)

p-dissociation

Elastic

Cut on z , (fwd.) energy,
add'l tracks, ...

“Forward tagging”

Zeus - J/ψ Electroproduction: inelasticity

- KZ(CS+CO): too high at large z values (high- z resummation needed?)
- CS predictions are consistent with data

Zeus - J/ψ Electroproduction: p_T^2 and p_T^{*2}

KZ (CS) and LZ(CS): too soft in comparison to data
 KZ (CS+CO): overshoots data at low p_T^* values
 LZ (kt, CS): too soft as well (NLO corrections?)

Zeus - J/ψ Electroproduction: rapidity

LZ (kt, CS) tends to be above the data in photon direction

HERA vs. Tevatron ME

- Only use theoretically safe regime: $p_T^2, Q^2 > 4 \text{ GeV}^2, M_X > 10 \text{ GeV}$
 - ◆ Statistics limited in 1999
- Consistent description difficult
- Repeat including recent data?
- Common fit?

$$\langle {}^1S_0^{(8)} \rangle + 3/m_c^2 \langle {}^3P_J^{(8)} \rangle$$

hep-ph/9911384

Upsilon Production : $\sigma(pA \rightarrow \Upsilon)$

$\Upsilon \rightarrow \mu^+ \mu^-$

Υ events 35 ± 8
 Width 157 MeV

$\Upsilon \rightarrow e^+ e^-$

Υ events 33 ± 10
 Width 335 MeV

Width : in agreement with MC

Measurement of the Υ production cross section is feasible
 may help to distinguish between Fermilab fixed target measurements

Existing measurements by
 E605, E771
 contradictory

Prompt $\chi_{c1(2)}$ production at BELLE

$$e^+e^- \rightarrow \chi_{c1(2)} X$$

PRL 89 (2002)142001

EPS-ID 562

101.8 fb⁻¹

$$2.8 < M_{\text{recoil}}(\text{J}/\psi\gamma) < 3.8$$

Search for η_b at CDF

$\eta_b \rightarrow J/\psi J/\psi$ reconstruction

Braaten, Fleming, Leibovich
PRD 63 (2001) 094006

Expected production rate:

$$\sigma(\eta_b) \sim (3-6) \times \sigma(\Upsilon(1S))$$

$$B(\eta_b \rightarrow J/\psi J/\psi) \sim 7 \times 10^{-4 \pm 1}$$

100 pb⁻¹

Possibly seen in Run I?

Small cluster: 7 events, 1.8 events expected from background

CDF mass resolution $\sim 10 \text{ MeV}/c^2$

Search window 9.36 to 9.46 GeV/c²

Simple mass fit: $9445 \pm 6(\text{stat}) \text{ MeV}/c^2$

Probability of background fluctuation: 1.5% ($\sim 2.2 \sigma$)

Search for η_b at CDF

$\eta_b \rightarrow J/\psi J/\psi$ reconstruction

Rate Limit:

$$\sigma\eta_b(|y|<0.4) B(\eta_b \rightarrow J/\psi J/\psi) [B(J/\psi \rightarrow \mu\mu)]^2 < 18 \text{ pb}$$

Central value **3.5 pb**

Improves apparent significance
Supportive of signal hypothesis
Need more data for confirmation
