

Top Quark Mass and Kinematics

Emanuela Barberis

Northeastern University, Boston

for the CDF and DØ Collaborations

- Top quarks at the Tevatron
- General techniques for measuring the top mass
- Mass in the ℓ +jets channel
- Mass in the dilepton channel
- Anomalous kinematics
- $t\bar{t}$ mass spectrum

Introduction

Top Quark Production and Decay

- In proton anti-proton collisions at Tevatron energies, top quarks are primarily produced in pairs via strong interactions

- EW single top production: not yet observed

- $\text{Br}(t \rightarrow Wb) \sim 100\%$

$t\bar{t}$ decay modes

The Top Quark mass

Fundamental parameter of the Standard Model

- Affects predictions of SM via radiative corrections
 $\Rightarrow m_t$ can be related, with m_W , to the Higgs mass

$$\delta m_W \propto m_t^2, \ln(m_H)$$

- m_t is roughly $\frac{1}{2}$ the vacuum expectation value of the Higgs field
 \Rightarrow probing the EWSB mechanism (new physics?)

Precision measurement $\Rightarrow 2 \text{ fb}^{-1}$ projection: $\delta m_t \sim 1.5 \text{ GeV}$ ($\delta M_H / M_H = 30\%$)

CDF and DØ, the Tevatron detectors

- Precise tracking and vertexing: new silicon vertex detectors. Tracking chambers and TOF (CDF)/ fiber tracker (DØ).
 - Upgraded calorimeters, preshowerers.
 - Upgraded Muon systems.
 - Upgraded DAQ/trigger systems.

Data taking efficiency: $\geq 85\%$

Run II results presented here: 160-750 pb⁻¹

Top mass measurement ingredients

Precision measurement \Rightarrow maximize statistical significance with sophisticated mass extraction techniques + minimize systematic uncertainties (jet energy scale, signal/background modeling).

Main mass extraction techniques:

- **Template methods:** typically, one mass per event from kinematic fit, compare data to MC templates. \longrightarrow
- **Dynamical methods:** event by event weights according to quality of agreement with Standard Model top and background differential cross-sections. \searrow

$$P(x; m_{\text{top}}) = \frac{1}{\sigma} \int d^n \sigma(y; m_{\text{top}}) dq_1 dq_2 f(q_1) f(q_2) W(x | y)$$

differential cross-section (LO matrix element)

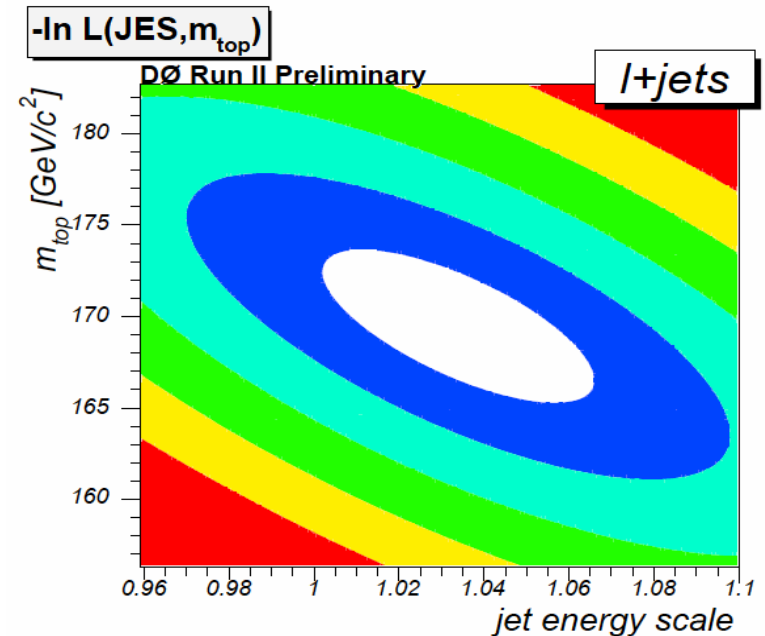

PDF's

Transfer function: mapping from parton level variables (y) to reconstructed level variables (x)⁶

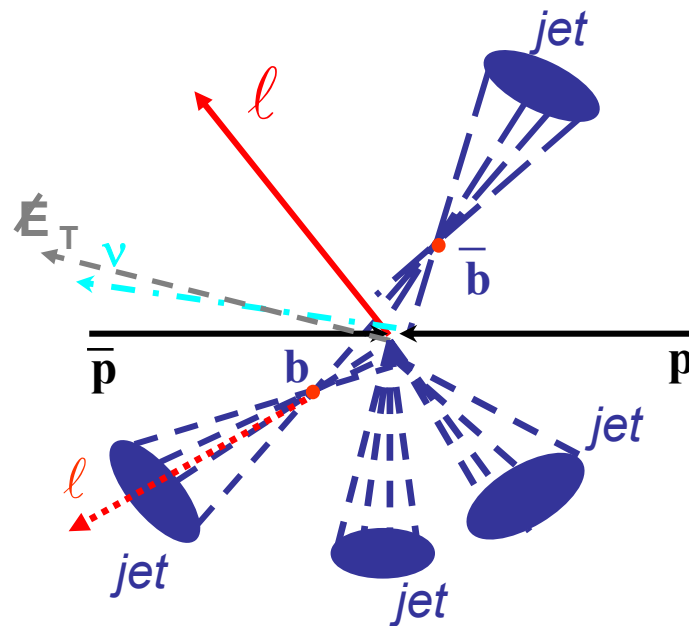

Top mass measurement ingredients

Handles on systematic uncertainties:

- JES systematic can be reduced with in-situ calibration of the hadronic W mass in top decays \Rightarrow simultaneous determination of M_{top} and JES from reconstructed m_{top} and M_W templates.
- b-tagging can be used to reduce physics backgrounds as well combinatorial.
- Many systematical uncertainties are expected to decrease with larger data samples.

Mass in the ℓ +jets channel

$$\begin{array}{c}
 t(\rightarrow W^\pm b) \quad t(\rightarrow W^\pm b) \\
 \downarrow \qquad \qquad \downarrow \\
 e^\pm, \mu^\pm \qquad \quad qq
 \end{array}$$

CDF: Template Method, 680 pb⁻¹

Reconstructed m_{top} and m_{jj} from data are compared to templates of various true M_{top} and Δ_{JES} (jet energy calibration shift) using an unbinned likelihood fit

⇒ uses *in-situ* m_{W} constraint to calibrate the jet energy scale.

Event selection:

- 1 e or μ with $p_{\text{T}} > 20$ GeV
- $E_{\text{T}}^{\text{miss}} > 20$ GeV
- 4 exclusive samples with different jet pT selections:
0, 1 (L/T), 2 b-tags

360 candidates, 4 samples with different S/B and sensitivity to M_{top} :

- 0 b-tag : 4 jets $E_{\text{T}} > 21$ GeV
- 1 b-tag (loose) : 3 jets $E_{\text{T}} > 15$ GeV, 4th jet $8 \text{ GeV} < E_{\text{T}} < 15 \text{ GeV}$ (S:B = 1:1)
- 1 b-tag (tight) : 4 jets $E_{\text{T}} > 15$ GeV (S:B = 4:1)
- 2 b-tags: 3 jets $E_{\text{T}} > 15$ GeV, 4th jet $E_{\text{T}} > 8$ GeV (S:B = 11:1)

Backgrounds:

	2-tag	1-tag(T)	1-tag(L)	0-tag
Non-w(QCD)	0.6 ± 0.2	5.0 ± 1.4	4.4 ± 1.4	
W+Heavy Flavor	2.4 ± 1.0	8.4 ± 3.0	14.6 ± 4.7	
W+light jets	0.9 ± 0.2	6.9 ± 1.4	8.9 ± 1.9	100%
WW/WZ	0.11 ± 0.03	1.0 ± 0.3	1.5 ± 0.4	
Single Top	0.02 ± 0.01	1.1 ± 0.3	1.3 ± 0.3	
Total Background	4.0 ± 1.3	22.2 ± 4.7	30.6 ± 6.7	
$t\bar{t}$ ($\sigma_{t\bar{t}} = 6.1$ pb)	42.8	82.2	33.6	
Total	46.8	104.4	64.2	

CDF: Template Method, 680 pb⁻¹

m_{top} reconstruction: from kinematic fit that yields the lowest χ^2 (with $\chi^2 < 9$)

$$\chi^2 = \sum_{i=\ell, 4\text{jets}} \frac{(\hat{p}_T^i - p_T^i)^2}{\sigma_i^2} + \sum_{j=x,y} \frac{(\hat{p}_j^{UE} - p_j^{UE})^2}{\sigma_j^2} + \frac{(m_{jj} - m_W)^2}{\Gamma_W^2} + \frac{(m_{\ell\nu} - m_W)^2}{\Gamma_W^2} + \frac{(m_{bjj} - m_t^{reco})^2}{\Gamma_t^2} + \frac{(m_{b\ell\nu} - m_t^{reco})^2}{\Gamma_t^2}$$

m_{jj} reconstruction: uses all combinations of untagged jets

Template fits: parametrization of m_{top} and m_{jj} for input values of M_{top} and Δ_{JES} (signal) + parametrization of m_{top}, m_{jj} background shapes \Rightarrow probabilities

Unbinned Likelihood fit: extraction of M_{top}, Δ_{JES} , n_s, n_b (constructed from the probabilities determined with the Template fits)

CDF: Template Method, 680 pb⁻¹

Likelihood for each sample: $\mathcal{L}_{\text{sample}} = \mathcal{L}_{\text{shape}}^{m_t^{\text{reco}}} \times \mathcal{L}_{\text{shape}}^{m_{jj}} \times \mathcal{L}_{\text{nev}} \times \mathcal{L}_{\text{bg}}$

Gaussian constraint on Δ_{JES}

Combined Likelihood: $\mathcal{L}_{\text{total}}(m_t, \text{JES}) = \mathcal{L}_{2\text{-tag}} \times \mathcal{L}_{1\text{-tag(T)}} \times \mathcal{L}_{1\text{-tag(L)}} \times \mathcal{L}_{0\text{-tag}} \times \mathcal{L}_{\text{JES}}$

External JES calibration uncertainty: 3 GeV

M_{jj} in-situ calibration leads to a 40% improvement on the external σ_{JES}

Combined Likelihood Δ_{JES} vs M_{top} :

CDF Run II Preliminary (680 pb⁻¹)

Systematic uncertainties:

DØ: Ideogram Method, 160 pb⁻¹

Same kinematic fitting and discriminant as the Template analysis.
Event-by-event likelihood, each event gives a distribution of masses.

$$\mathcal{L}_{evt}(m_{top}, P_{sample}) = P_{evt} \left[\sum e^{-\frac{1}{2}\chi_i^2} G(m_i, m', \sigma_i) BW(m', m_{top}) dm' + (1 - P_{evt}) \sum e^{-\frac{1}{2}\chi_i^2} BG(m_i) \right]$$

discriminant (points to P_{evt})
combinatorics weight (points to $e^{-\frac{1}{2}\chi_i^2}$)
Gaussian resolutions (points to $G(m_i, m', \sigma_i)$)
Signal Breit-Wigner's (points to $BW(m', m_{top})$)
Background shape (points to $BG(m_i)$)

$$M_{top} = 177.5 \pm 5.8(\text{stat}) \pm 7.1(\text{sys}) \text{ GeV}/c^2$$

CDF: Decay Length Method, 695 pb⁻¹

Uncorrelated to other measurements:
relies on tracking (no dependency on JES)

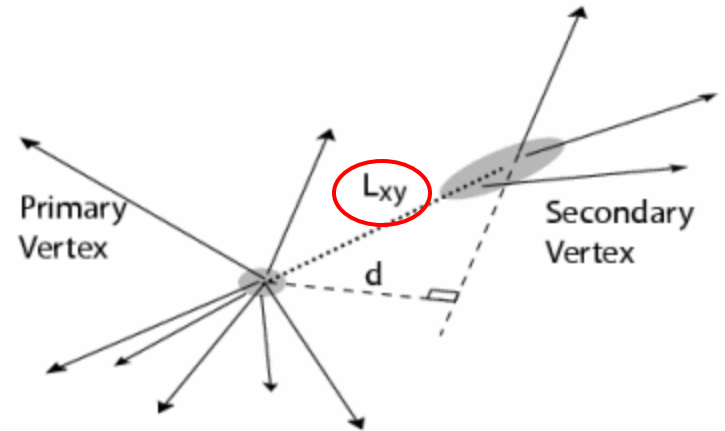

Boost of b-quarks is correlated to m_{top} :

$$\gamma_b = \frac{m_t^2 + m_b^2 - m_W^2}{2m_t m_b} \approx 0.4 \frac{m_t}{m_b}$$

use b-lifetime, or $\langle L_{xy} \rangle$, to infer m_{top}

Event Selection

- 1 e or μ with $p_T > 20$ GeV
- $E_{T,\text{miss}} > 20$ GeV
- ≥ 3 jets, $E_T > 15$ GeV
- ≥ 1 b-tagged jet

Transverse Decay Length - Tagged W + ≥ 3 Jet Events

CDF: Decay Length Method, 695 pb⁻¹

Transverse Decay Length

Top Mass 1 σ Confidence Intervals - Measured $\langle L_{xy} \rangle$ Overlaid

DØ: Matrix Element Method, 320 pb⁻¹

Pioneered by DØ with re-analysis of Run I data \Rightarrow uses *in-situ* M_W constraint to calibrate the jet energy scale.

Makes maximal use of information in each event by calculating event-by-event probability to be signal or background, based on the respective matrix elements:

$$P_{evt}(x; m_{top}, JES) = f_{top} P_{sig}(x; m_{top}, JES) + (1 - f_{top}) P_{bkg}(x; JES)$$

- x : reconstructed lepton and jets kinematics
- JES from M_W constraint.
- Signal and background probabilities: from differential cross-sections

$$P(x; m_{top}) = \frac{1}{\sigma} \int d^n \sigma(y; m_{top}) dq_1 dq_2 f(q_1) f(q_2) W(x, y)$$

- All events are combined in a likelihood

$$-\ln L(x_1, \dots, x_n; m_{top}, JES) = -\sum_{i=1}^n \ln P_{evt}(x_i; m_{top}, JES)$$

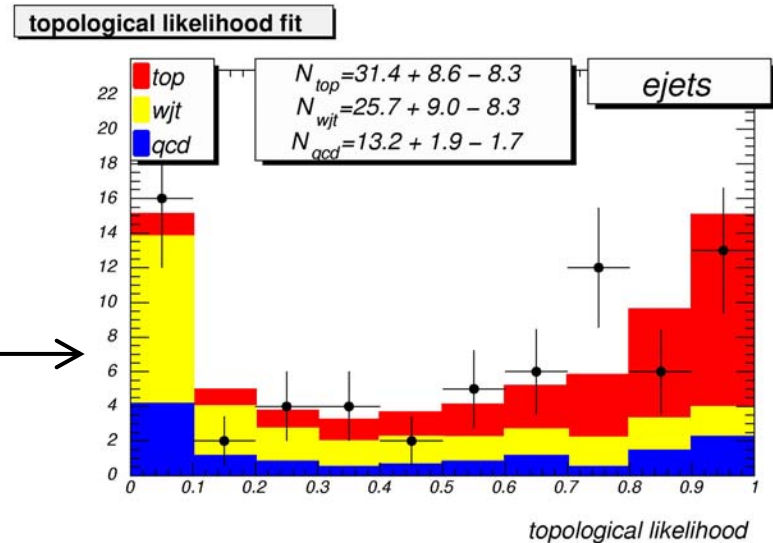

- Likelihood is maximized as a function of m_{top} and JES.

DØ: Matrix Element Method, 320 pb⁻¹

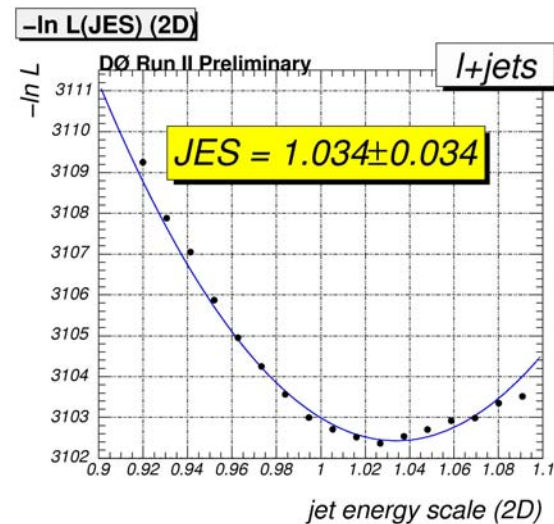

Event selection:

- 1 e or μ with $p_T > 20$ GeV
- $E_{T,miss} > 20$ GeV, $\Delta\phi(E_{T,miss}, \ell)$ cut
- = 4 jets, $E_T > 20$ GeV
- Signal and background fractions cross-checked with a likelihood fit
- 150 candidates, S:B = 1:2

Simultaneous fit of m_{top} , JES, and f_{top} :

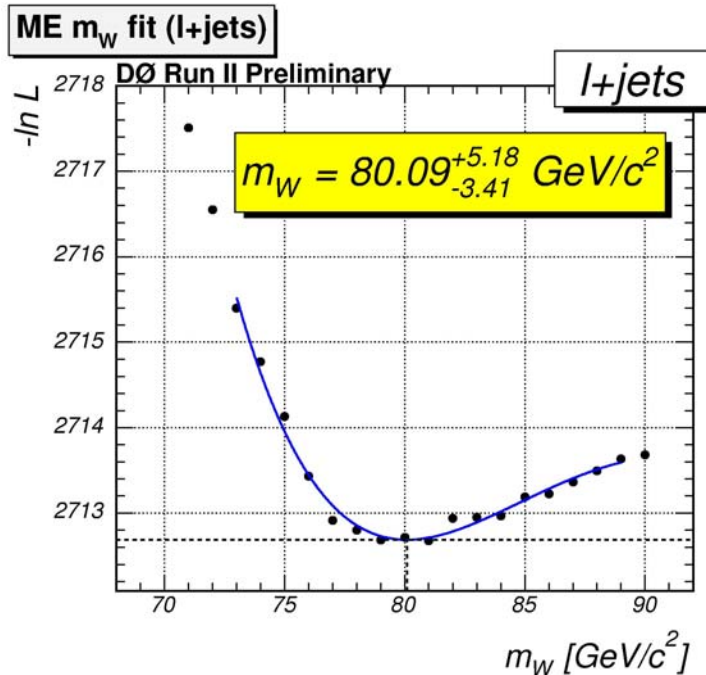

m_{top} and JES
projections \Rightarrow

- 63 candidates, S:B = 6:1

Likelihood based on event-by event probability to be signal from $t\bar{t}b$ LO Matrix Element.

Shift on m_{top} estimated as a function of background fraction (14.5% in the data)

$$M_{top} = 173.2^{+2.6}_{-2.4} \text{ (stat)} \\ \pm 3.2 \text{ (sys)} \text{ GeV}/c^2$$

Mass in the $\ell\ell$ +jets channel

$$\begin{array}{c}
 t(\rightarrow W^+b) \quad t(\rightarrow W^-b) \\
 \downarrow \qquad \qquad \downarrow \\
 e^+, \mu^+ \qquad e^-, \mu^-
 \end{array}$$

DØ: Template Methods, Matrix Weighting 370 pb⁻¹

General: the dilepton channel is underconstrained. Template methods assume values for certain variables in order to extract a solution, and assign weights to the different solutions.

The matrix Weighting method scans over top masses and assigns a weight to the solution, based on the Matrix Element predictions for the lepton p_T's:

$$W_o(m_{top}) = \sum_{solutions} \sum_{jets} f_{PDF}(x) f_{PDF}(\bar{x}) p(E_l^* | m_{top}) p(E_{\bar{l}}^* | m_{top})$$

- binned maximum likelihood fit to signal and background templates

Event selection:

eμ channel

- 1 e, p_T(e) > 15 GeV
- 1 μ, p_T(μ) > 15 GeV
- H_T > 122 GeV
- ≥ 2 jets, E_T > 20 GeV

ee channel

- 2 e's, p_T(e) > 15 GeV
- m_{ee} < 80 (> 100) GeV
- ≥ 2 jets, E_T > 20 GeV
- E_T^{miss} > 40 (35) GeV
[m_{ee} < 80 (> 100) GeV]
- sphericity > 0.15

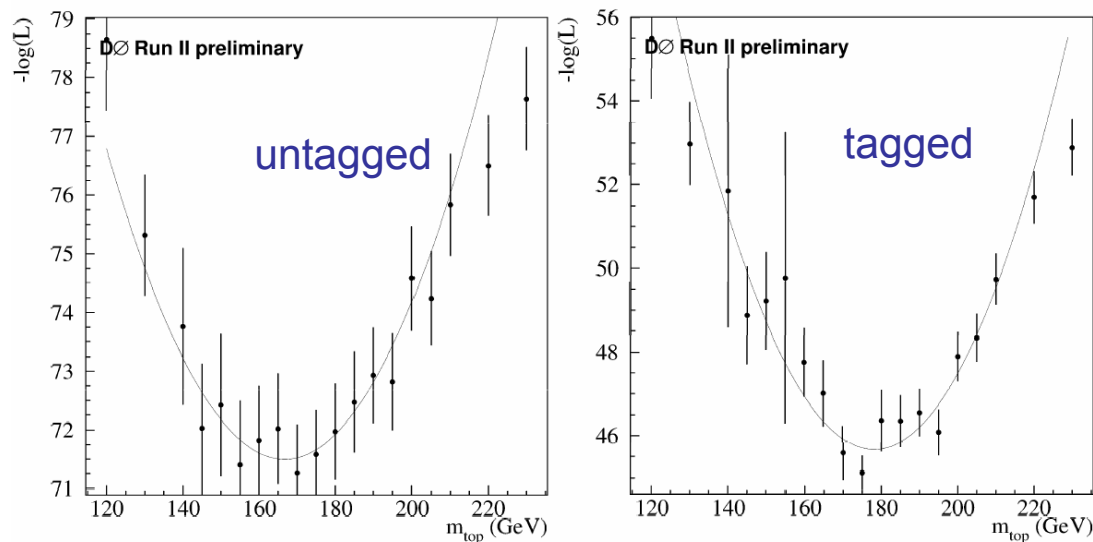

μμ channel

- 2 μ, p_T(μ) > 15 GeV
- contour cut on E_T^{miss}
and Δφ(μ₁, E_T^{miss})
- ≥ 2 jets, E_T > 20 GeV
- Z fitter χ² test

DØ: Template Methods, Matrix Weighting 370 pb⁻¹

- Untagged analysis: 21 candidates, S:B = 4:1
- b-tagged (≥ 1 b-tag) analysis: 14 candidates, S:B = 48:1

Likelihood fits:

Systematic uncertainties:

	<u>untagged</u>	<u>tagged</u>

$$M_{\text{top}} = 165.0 \pm 13.5(\text{stat}) \pm 3.8(\text{sys}) \text{GeV}/c^2 \quad \text{untagged}$$

$$M_{\text{top}} = 176.6 \pm 11.2(\text{stat}) \pm 3.8(\text{sys}) \text{GeV}/c^2 \quad \text{tagged}$$

DØ: Template Methods, Neutrino Weighting 370 pb⁻¹

The Neutrino Weighting method scans over top masses and the η 's of the two neutrinos and assigns a weight (as a function of m_{top}) to the solution, based on the agreement of the calculated neutrino p_T 's and the observed E_T^{miss}

$$w = \frac{1}{N_{\text{iter}}} \sum_{i=1}^{N_{\text{iter}}} \exp\left(\frac{-(E_{x,i}^{\text{calc}} - E_x^{\text{obs}})^2}{2\sigma_{E_x}^2}\right) \exp\left(\frac{-(E_{y,i}^{\text{calc}} - E_y^{\text{obs}})^2}{2\sigma_{E_y}^2}\right)$$

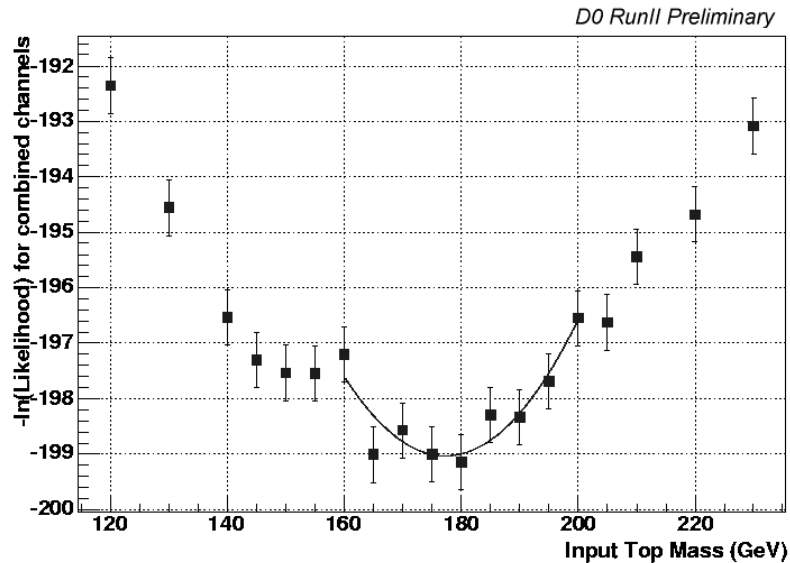

- maximum likelihood fit to signal and background templates

Event selection: similar to the matrix weighting measurement, only exception: simpler electron likelihood cut, $E_T^{\text{miss}} > 25$ GeV, and $H_T(\ell, \text{jets}) > 144$ GeV in the ee channel.

- Untagged analysis: 21 candidates, S:B = 4:1

DØ: Template Methods, Neutrino Weighting 370 pb⁻¹

⇒ most precise dilepton measurement

Dynamical Likelihood Method (340 pb⁻¹):

$$M_{\text{top}} = 166.6^{+7.3}_{-6.7}(\text{stat}) \pm 3.2(\text{sys}) \text{ GeV}/c^2$$

Mass summary & combination

Top quark mass: Summary

DØ Run II Preliminary

CDF average $M_{\text{top}} = 172.0 \pm 2.7 \text{ GeV}$

- New Run II measurements achieving better uncertainties than Run I world average.
- EPS 2005 Run I+ Run II world average: \longrightarrow

$$M_{\text{top}} = 172.7 \pm 2.9 \text{ GeV}; \chi^2/\text{dof} = 6.5/7$$

Impact on SM Higgs boson:

$$M_{\text{H}} = 91_{-32}^{+45} \text{ GeV}; M_{\text{H}} < 186 \text{ GeV} @ 95\% \text{CL}$$

\Rightarrow uncertainty now dominated by ΔM_{W}

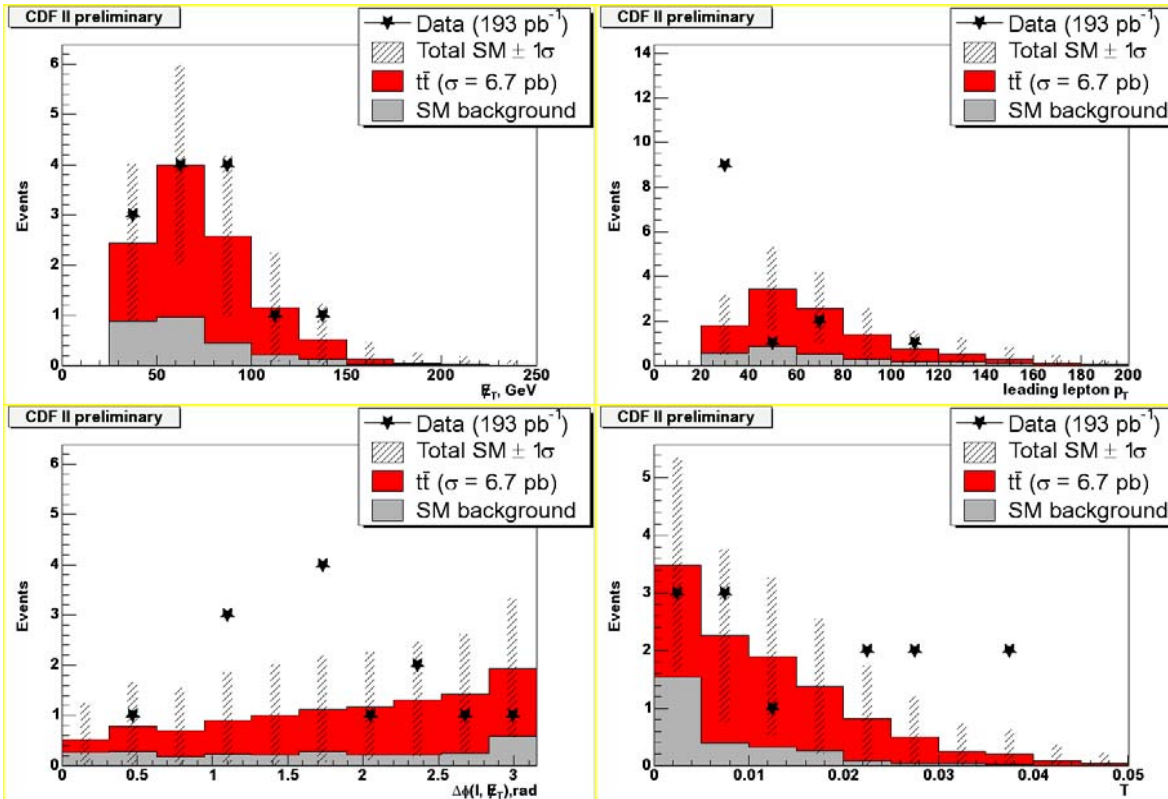

Search for new physics

Anomalous ttbar kinematics

Estimate consistency of observed kinematics of the ttbar system with SM
(in Run I, several CDF events at high E_T^{miss} and $p_{T\ell}$)

four chosen variables: E_T^{miss} , $p_{T\ell}$, $\Delta\phi(\ell, E_T^{\text{miss}})$, dilepton “topology” (T)

$$T_w = \int \exp \left\{ - \frac{(\vec{E}_T^{\text{predicted}} - \vec{E}_T^{\text{measured}})^2}{2\sigma_{E_T}^2} \right\} d\vec{E}_T^{\text{predicted}}$$

CDF, 193 pb⁻¹
consistent with
the SM with
a probability of
1-4.5%

Model independent
search for new
physics

DØ: tt̄ mass spectrum

Search for new particles in Top production, leading to a resonance in the tt̄ mass spectrum

- $\ell + \geq 4$ jets candidate events (≥ 1 b-tag), 370 pb^{-1}
- tt̄ invariant mass reconstructed with tt̄ production hypothesis (kinematic fitting)
- Model independent limits on $\sigma_X \text{Br}(X \rightarrow \text{tt̄})$

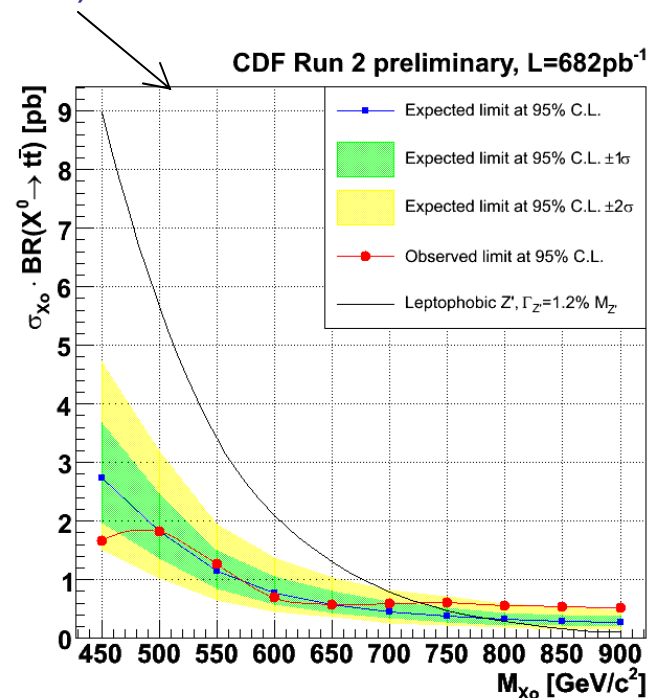

Limit on a narrow leptophobic Z' (total width $\Gamma_{Z'} = 1.2\% M_{Z'}$):

$M_{Z'} > 680 \text{ GeV}$ at 95% CL

CDF: $t\bar{t}$ mass spectrum

- $\ell+\geq 4$ jets candidate events, 682pb^{-1}
- $t\bar{t}$ invariant mass reconstructed with $t\bar{t}$ production hypothesis (likelihood incorporating LO matrix element for $t\bar{t}$)
- Model independent limits on $\sigma \times \text{Br}(X \rightarrow t\bar{t})$

Limit on a narrow leptophobic Z' ($\Gamma_{Z'}=1.2\%M_{Z'}$):

$M_{Z'} > 725\text{ GeV}$ at 95% CL

Summary and conclusions

Results on Top mass and kinematics presented for datasets up to 750 pb^{-1} , with single mass measurements already exceeding past world average values.

The excellent performance of the Tevatron and the CDF and DØ experiments are the key to precision measurements in top physics and to the search for new physics coupled to the top quark.

It's good to look behind us, but the real excitement is in what lies ahead!
