O Heraeus Instruments GmbH. 63450 Hanau, Germany

function line* is a registered trademark of Heraeus Instruments GmbH

The German version of this Instruction manual applies in the event of any deviations in the translation.

Nominal charge

This instruct	This instruction manual applies for the following models:						
Order No.	Model	Equipment					
50 042 298	UT6P	Air circulation oven, programmed controller, 1/PE AC, 230 V; 50/60 Hz					
50 042 300	UT6P	Air circulation oven, programmed controller, 1/PE AC, 120 V; 50/60 Hz					
SO 042 306	UT12P	Air circulation oven, programmed controller, 1/PE AC, 230 V; 50/60 Hz					
50 042 312	UT20P	Air circulation oven, programmed controller, 1/PE AC, 230 V; 50/60 Hz					

These heating cabinets must be operated in accordance with the instruction manual and may only be used for their intended applications in order to ensure the safety of personnel, the environment and the processed items and materials.

Read the instruction manual carefully before using the equipment and comply with the instructions that it contains to avoid making mistakes and to prevent any personal injury or damage to property.

General information

The unit fulfils the following safety standards: DIN EN 61 010-1/03.94. VDE 0411 Part 1/03/94, E DIN VDE 0411 Part 111. DIN 12 880 Part 1 /11.78 and DIN EN 60 335 - 1, VDE 0700 Part 1 DIN EN 55 011 Part 3, DIN VDE 0875 Part 11 /07. '92

Q' Always quote the data on the rating plate when requesting information or ordering spare parts

Operating instructions

The operator must provide anybody working on or with this equipment with written instructions for any operations to be performed. Such instructions must be easy to understand and must be available in the language of the respective personnel (FRG: UW VBG 1 § 7 (2)).

Log book

We recommend that a log book is kept, which records any tests and calibration operations performed on the unit and any other work (repairs, modifications etc.).

Field of application

The unit has been designed as an item of laboratory equipment for technical applications.

- Heat treatment of samples or materials with operating temperatures of between room temperature + approx. 20°C and 250 'C, e.g. for drying, ageing, analysis, fusing, burning In, oxidizing, reducing, preheating, etc.
- Hot-air sterilization, sterilization by heating the article up to a temperature of at least 160 'C (FRG: also refer to DIN 58 947).

Note: Th« ilerillzation temperature usually required in the fleW of medical laboratory work l> 110 *C.

The unit has been designed for installation and operation in the following fields:

 Laboratories, e.g. in the commercial or industrial sector, schools, universities, hospitals and biology

The unit is equipped with an independent overtemperature protection device, which means that it does not require constant supervision.

The heating unit has been designed for continuous use.

Make sure that an adequate clearance is maintained between the inside walls of the inner compartment and the loaded articles, and between the various layers of loaded articles, to prevent uneven heating of the materials.

Protective gloves, goggles etc. must be made available to the operator because of the potentially high operating temperatures.

The unit must not be used to dry or heat substances which may release combustible gases or vapours into the atmosphere, which could bum or explode when mixed with air. The heating unit is equally unsuitable for the heat treatment of combustible dusts or fibrous materials.

Safety instructions

Comply with the Instructions in this manual and keep it In the vicinity of the unit.

These units must be operated in accordance with the Instruction manual and may only be used for their Intended applications in order to ensure the safety of personnel, the environment and the processed items and materials.

Read the Instruction manual carefully and comply with the instructions that it contains to avoid making mistakes and to prevent any peronal injury or damage to properly.

Unit must be operated by instructed personnel.

Keep unit out of reach of children.

Apart from the Instructions in this manual, the respective national regulations must also be observed for the installation and operation of this unit (FRG: ZH 1/119, DIN 12 880 Part 1).

The applicable national environmental regulations must be observed for the extraction of exhaust gases that are produced during heat treatment. Suitable measures must be Implemented to ensure that such gases are safely led outside (FRG: BImSchG, UVPG, AbfG, WHG, ChemG, ...).

The unit must not be used to dry or heat substances which may release combustible gases or vapours into the atmosphere, which could bum or explode when mixed with air. The unit is equally unsuitable for the heat treatment of combustible dusts or fibrous materials.

Check the mains lead and connector for damage before using the unit. If there are any signs of damage, do not connect the unit up to the mains.

The voltage quoted on the rating plate (rated voltage) must agree with the mains supply voltage.

Protective gloves, goggles etc. must be made available to the operator because of the potentially high operating temperatures.

The surfaces around the opening of the Inner compartment become hot at high operating temperatures • RISK OF BURNING - Avoid contact with these surfaces.

Ensure that the overtemperature protection device works properly by conducting a functional check at regular Intervals, every 3 months at least, and check the electrical equipment at least once a year.

Any work to be conducted on the electrical equipment of the unit may only be performed by a qualified electrician. The unit must be disconnected from the mains supply before commencing service or repair work.

Only use approved accessories and approved genuine spare parts. The use of any other parts may result in unforeseen problems and should be avoided under all circumstances.

The serviceability and safety of the unit can only be guaranteed if the necessary tests, maintenance, servicing and repair work Is carried out by the Heraeus service personnel or other agencies who are authorized to act on our behalf.

Heraeus Instruments GmbH cannot accept any liability for any damage that occurs as a result or improper use or repair work, which has not been performed by Heraeus service centers, or if parts other than the approved genuine spare parts / accessories are used.

2 SETUP AND INSTALLATION

1.D Transport

Handle the unit with care. Avoid jarring and protect against damage. Do not lift by the door handle, the door itself, the control unit, the blower box, the spacer or the power lead.

Refer to the TECHNICAL DATA for dimensions and weight.

• Unpacking the unit:

Unpack the unit, remove the transport safety fixtures from the inner compartment and remove any dirt or dust which may have accumulated in transit.

\triangle

Installation

The unit must be installed in a dry environment.

The relative humidity should be between 60 and ZO % under normal conditions.

Condensation should be avoided. If condensation has formed on the unit following a change of location or during transporalion. for example, wait until the unit has dried out completely before putting into operation.

The ambient air should not contain excessive amounts of dust.

(Comply with the instructions in the MAINTENANCE section).

Do not cover or obstruct the ventilation or exhaust vents in the unit housing, remove any dust or dirt with a vacuum cleaner.

The ambient temperature should not exceed 40 *C.

Place the unit on a firm, fireproof surface (e.g. laboratory table, support frame) in a stable, perfectly upright position.

Keep the unit away from direct sunlight (UV radiation).

If you wish to **stack** two units on top of one another, use the **stacking frame** (available as an option). Never stack more than two units on top of one another. When stacking units of different types, make sure that e.g. an Incubator is always at the bottom, and prevent any mutual influence.

Fig. 1/2: Clearances to adjacent surfaces / objects:

Maintain a distance from the back: UT6P: at least 12 cm UT12P: at least 8 cm UT20P: at least 8 cm

The wall spacer may only be removed if the unit is connected up to an extraction system.

The exhaust gases must be led through / past adjacent surfaces / objects located above or behind the unit with heat insulation to avoid the danger of fire.

If the unit UT 6 P is to be fitted under a **table** or into a **laboratory** fixture, it must be connected to an exhaust air extraction system. The top clearance may only be reduced to min. 5 cm under such circumstances. Ensure adequate ventilation.

Types UT 12 P and UT 20 P are not suitable to be fitted under a table.

Room ventilation

Adequate ventilation must be provided wherever the unit is installed.

Do not operate the unit In non-ventilated enclosed spaces.

Special ventilation measures (e.g. ventilation of designated work areas, FRG: also refer to VDI 1946 Part 7) when several units are Installed in one room.

A Mains connection

The laboratory unit is supplied with a permanently connected, flexible mains power lead with connector (grounded).

The connector serves to disconnect the unit from the mains power supply.

Examine the power lead and connector for damage before using the unit. If there are any signs of damage, do not connect the unit to the mains supply.

The voltage quoted on the rating plate (rated voltage) must agree with the nominal mains voltage.

The unit may only be connected up to the mains via a properly Installed socket outlet with PE conductor (protection class I) or a permanent terminal connection. In the event of a permanent terminal connection, a master switch (lockable In the "Off" position) must also be installed to disconnect the unit from the mains.

An earth-leakage circuit-breaker should also be fitted in the supply system to provide additional protection against electric shocks.

Rubber-sheathed flexible cable of at least 2.5 mm³ diameter (H 07 RN-F ...) should be used for any extensions that may be required to connect the unit.

Refer to the TECHNICAL DATA section for the rated power consumption, circuit protection with a T16 A fusible link or a 8 16 circuit-breaker.

Noise Insulation

The unit develops a constant noise load.

Refer to the TECHNICAL DATA section for the noise level.

The unit may produce higher noise levels In unfavorable Installation conditions. Supplementary measures may have to be Implemented to Improve the sound insulation in the room.

/jl Connecting to an extraction system

Comply with the applicable national environmental regulations for the extraction of exhaust gases released during the heat treatment. Suitable measures must be implemented to ensure that such gases are safely led outside (FRG: BlmSchG). Such measures may involve thermal or catalytic treatment of flue gases.

Refer to the TECHNICAL DATA section for the volume flow and temperature of the exhaust gases.

Fig. 2/2: Example of an installation

Implementation instructions:

- · A draft breaker must be used to connect the unit to an extraction system.
- · All flue ducts must be made of fireproof materials.
- Apertures must be provided to enable the removal of residue and condensate. The flue ducts must be thermally insulated (recommendation: half-shell sleeves made of laminated mineral Tiber).
- The exhaust air / gases from the unit must never come into contact with combustion exhaust gases.
- Use the draft breaker to adjust the air flow volume in such a way that exhaust gases can be extracted reliably without producing any eddying at the unit's exhaust-gas connector.
- Technical measures should be implemented to monitor the flow of air and flue gases and to
 prevent operation of the heating unit if the ventilation system Is switched off / defective
 (electrical interlock).

Fig. 1/3: Overview of the control elements

Item A: Swltchgear unit

Fig. 2/3: Switchgear unit control panel

ON / OFF switch:

To switch the unit on and off:

"on" = Unit switched on, the temperature Inside the unit appears on the display panel of the control unit,

"off' = Unit switched off, temperature display off.

• 2 & 3 Overtemperature protection device / signal lamp:

The unit is equipped with an electronic upper-limit cut-out device (TWB) of protection class 2 as defined by DIN 12 880 Part 1. II s electrically and functionally independent of the temperature control system. In the event of a fault In the unit heating system, the operational TWB shuts down the unit heating across all poles as soon as the temperature exceeds the preset value.

The red signal lamp Indicates activation of the protection function (Fig. 2/3: Item 3).

The unit must be reset manually, by pressing the control element.

* Allow the unit to cool down (by approx. 30 *C), press the control element, the red signal lamp will go out.

The operate value is adjusted with the help of a tool (coin, screwdriver...). Adjust (o the required protection level:

- · to upper temperature limit» unit protection (protects the unit and its environment).
- *• to approx. 10 *C higher than the operating temperature set on the control unit = material protection (protects the unit, Its environment and the loaded material).

Ensure that the overtemperature protection device works properly by conducting a functional check at regular Intervals, every 3 months at least, and check the electrical equipment at least once a year.

3. UNIT SPECIFICATION

• 2 & 3 Overtemperature protection device / signal lamp:

Functional test of the TWB

(Prerequisite: required working temperature (control unit) has been reached /remains constant) Set the TWB to approx. 10 - 20 'C below the temperature displayed on the control unit. The TWB must respond, the red signal lamp indicates "Fault".

The TWB is working properly. Press the control element to release the TWB.

Now set the TWB to the temperature limit for the required type of protection.

If "Fault" is signalled during operation:

Check the settings of the TWB and the control unit and correct if necessary. If set for "material protection", this may indicate a blower malfunction. If the problem persists, contact the service center.

4 Fresh-air flap control

For continuous control of the fresh-air supply to the inner compartment.

•* Set to left-hand stop = minimum fresh-air supply

*• Set to right-hand stop = maximum fresh-air supply

Item B: Automatic control unit

The automatic control unit **contains the basic functions** of a 2-posilion controller with PD/PID control response, time switch to switch the heating and ventilation on / off after the set time, the **added features of permanently programmed** heating process programs and the programmed **controller functions of a freely programmable** process controller.

Fig. 3/3: Control unit control panel

The status of the control unit is Indicated by signal lamps in the display panel.

- THE YELLOW SIGNAL LAMP (Item 1) indicates the current status of the heating control system:
- »• Lamp switched on unit heating activated
- . Lamp switched off heating off

Rhythmic flashing of this signal lamp indicates that the temperature controller is regulating the operating temperature.

- THE GREEN SIGNAL LAMP (Item 2) indicates the status of the control unit:
- •• Lamp off » control unit switched off: heating and blower disabled. The heating and blower are not activated when the unit is switched on.
- *• Lamp flashes * time-switch function activated.

Basic functions

The control unit is equipped with the "temperature control", "time switch" and "inside air speed adjustment" basic functions.

The unit can set an operating temperature of up to 250 *C, switching times of between 0:01 and 99:00 hours and and Inside air speed in stages of approx. 40 %, approx. 70 % and 100%.

Refer to STARTING UP WITH BASIC FUNCTIONS for information about the commands for the basic functions.

3. UNIT SPECIFICATION

Added-feature programming functions, fixed programs

The control unit is capable of running heating process programs with fixed, preselected parameters from a database.

The program segment and the parameters are stored in the database.

The fixed program contains a maximum of four program segments and a status command.

Fig. 4/3: Example of a temperalure/time process, controlled by the fixed program

Each program segment, P I - P 4, is assigned to a typical temperature / time response. 10 selectable sets of parameters are permanently stored In the database for each program segment. These sets of parameters can be assigned within the program.

A status command is provided as the fifth program segment. This determines the subsequent action with the program selected from the fixed program memory:

*	Program on standby, do not execute yet	= Select" P. o F'
••	Program on standby, wait for program start	 Select" P. o n"

• Delete program from memory completely • Select" P. r E "

The program memory is erased on delivery. If the operator Interrogates the program segments, "Parameter set off' appears in the display panel = e.g." P. I -".

When compiling a program, selecting "parameter set off" within the selected program segment causes the control unit to bypass this segment for the fixed program function.

The selected program always runs from program segment P I. n to program segment P 4. n.

If program segment P 3. n is combined with program segment P 4. n, the heating and blower are only switched off following termination of segment P 4. n.

If a program is interrupted and started again, the sequence commences at segment P I. n.

The previously selected operating temperature cannot be changed once the program has started.

The heating is switched off in the event of a power failure (> 20 ms) with subsequent restoration of the power supply, the temperature inside the unit Is displayed as a flashing value and the program must be started again.

3. UNIT SPECIFICATION

• Example of a fixed program

1.194.19

*• Example E1: Hot-air sterilization process

The heating should switch on in 8 hours, the unit should heat up to an operating temperature of 190 *C (sterilization temperature) at a rate of 200 *C/h, maintain this temperature for 4 hours (equalization phase and sterilization period) and should subsequently cool down at a rate of 20 •C/h.

The program should start following program selection (status command: P. on).

Fig. 5/3: Program profile - hot-air sterilization process El

Sequence E1:

After sketching the process characteristic, select the segments which correspond to the required sequence from the matrix .

Mark the program segments and the " P. o n" status command. Leave program Input mode. Select 190 "C as the required operating temperature. Start the fixed program. While the program is running the display alternates between the temperature inside the cabinet and the current program segment.

Refer to STARTING UP WITH ADDED-FEATURE PROGRAMMING FUNCTIONS for further information.

Programmed controller function

The programmed controller function enables the arbitrary definition of temperature / time processes.

You may select up to 9 program segments. Operating temperature, period and air speed level can be selected for each segment.

Termination commands

A termination command can be selected as the last program segment. The termination command determines the function to be performed by the unit after running through the program.

There are three optional termination commands:

- •• " hold " = Once the program has terminated, the operating temperature set for the last program segment is maintaned until a new operating temperature has been selected.
- * •• stOP " = Once the program has terminated, lhe heating and blower are switched off until the "stop" command Is cancelled.
- > CYCL "- Once the program has terminated, It returns to the beginning and is repeated continuously until the "CYCL" command is cancelled.

A termination command must always be entered at the end of every program.

Fig. 6/3: Example of a temperature / time / ventilation program with "CYCL" termination command

Definitions

n1 n9	Program segments
n10	Termination commands (hold, StOP or CYCL)
Т 1 Т 9	Specified operating temperature (SO - 250 *C)
11 t 9	Specified time - program segment (0:01 - 99:0 h)
U 1 U 3	Specified ventilation level (approx. 40 %. approx. 70 % and 100 %)

• Refer to STARTING UP WITH PROGRAMMED CONTROLLER FUNCTIONS for details.

4 OPERATION

What happens if ... ?

Possible display	Explanation
888	Control unit test phase
OFF	Status of the control unit, heating and ventilation disabled
One digit in the display flashes	The flashing value can be changed
	Program cogmont when entering on added feature program function
P 1.3	Program segment when entering an added-leadure program function
temperature	Program segment while the added-reature program is in progress
P. o n	Status command for an added-feature program: Program on standby, wait for program start
P. OF	Status command for an added-feature program: Program on standby, do not execute yet
P. rE	Status command for an added-feature program: Delete program from memory completely
Proalternating with inside temperature	Entered program on standby Power failure (> 20 ms) with subsequent restoration: the heating switches off, "P r o" alternates with the temperature inside the unit on the display, if a program is in progress It is Interrupted and must be started again.
n l	Program segment when entering and activating the programmed controller function.
hold	Termination command when entering the programmed controller function: the temperature set for the last program segment is maintained on termination of the program
stop	Termination command when entering the programmed controller function: the heating and ventilation is switched off on termination of the program
CYCL	Termination command when entering the programmed controller function: when the program is terminated, it retums to the beginning and starts again
	A termination command is entered for this program segment when entering the programmed controller function. The termination command must be changed to a time value to enable the input of a lemperature value.
E-3	Stored data defective Switch the unit off and on again. If the problem persists, contact the service center
E-4	Error of measurement in the reference values
E-S	Upper-limit violation of actual temperature tolerance - contact the service center -
E-6	Lower-limit violation of actual temperature tolerance - contact the service center -
E-7	Temperature sensor or input defective - contact the service center -
E-8	Stored data defective • contact the service center -
E-9	Erroneous reference values • contact the service center -

Operating guidelines

Remember to put on protective garments, e.g. gloves, goggles, mask, body protection, remove any items of jewellery before starting work.

Do not cover or obstruct the ventilation or exhaust vents in the unit housing. Always keep these vents free of dust and dirt.

· Loading:

Circulating air conducts the heat to the samples in the unit. Make sure that the samples are evenly distributed on the trays, and that they are arranged in such a way as to ensure an unimpeded (low of warm air throughout the cabinet, in order to prevent local overheating. Do not position the samples too close to the inner walls.

Fig. 4/4: Loading diagram

Be careful not to damage the temperature sensors in the inner chamber when loading.

I-Ji Never place samples on the floor of the chamberl

Keep the inner surfaces of the chamber free of dust and dirt. Never use aggressive chemicals which could damage the stainless steel finish.

Continually heating and cooling the unit over wide temperature ranges can detrimentally affect its service life. If used more frequently, it is better to keep the unit running in continuous mode at moderate temperatures.

$A_{\rm A}$ If not used for an extended period, disconnect the unit from the power supply.

- · Remove the samples from the chamber
- Allow the heating unit to cool down to room temperature
- Switch the unit off and disconnect from the mains
- Clean the inside surfaces of the chamber
 (also refer to the section on DECONTAMINATION, CLEANING ...)

Shutdown

The serviceability and safety of the heating unit can only be guaranteed if the necessary tests, maintenance, servicing, and repair work is carried out by the Heraeus service personnel or other agencies who are authorized to act on behalf of Heraeus Instruments GmbH.

Heraeus Instruments GmbH cannot accept any liability for any damage that occurs as a result of improper use or repair work, which has not been performed by Heraeus service centers, or if parts other than the approved genuine spare parts / accessories are used. We recommend that you enter into a service contract with our company Please conlacl us (or a guotation.

Decontamination / disinfection

The operator Is responsible for implementing suitable, effective measures to decontaminate the unit if it is used In connection with hazardous materials. Such measures must be conducted on a regular basis under normal operating conditions and in particular if such materials have been spilt or before commencing service work.

The stainless steel components inside the unit may be decontaminated by wiping out with a **disinfectant solution** In cases of biological contamination.

(FRG sales: Handelsvertretung Helmut Schroder, GaufistraBe 30/2, 70193 Stuttgart).

The applicable national regulations must be observed with respect to disinfection (FRG: ZH 1/598 ...)

Once removed, the internal stainless steel components may also be subjected to steam sterilization or autoclave treatment.

Cleaning

Use a mild soap solution (water and mild detergent) and a soft lint-free cloth lo wipe the outer surfaces and control elements of the unit.

Remove any dust deposits from the air vents with a vacuum cleaner.

Remove any dust or dirt from the inner chamber. Use stainless steel cleaning agents in moderate quantities. Never use acids, chloric solvents or salt solutions to clean the stainless steel surfaces inside the unit.

Avoid scouring and scratching, or damage to labels and paintwork will be unavoidable.

Include flue/exhaust ducts In the cleaning operations if the unit is connected up to an extraction system.

Consult the manufacturer before implementing any other cleaning or disinfection measures than those mentioned in this manual to ensure that the intended methods will not damage the unit.

Servicing

The heating unil is virtually maintenance-free.

Lubricate the bearing s of the door and door-handle mechanisms with a little synthetic oil from time to time.

Tests

The following items should be tested at least once a year to ensure that the unit remains in good working order:

- Mechanical (unctions
- Operation in accordance with the specified technical data
- Electrical system (FRG: UVV VBG 4, OIN VOE 0701 Part 1, E DIN VOE 0702 /11.93)
- · Safety devices

Æ

Repairs

Only approved genuine spare parts and accessories may be used.

The use of other parts may result in unforeseen problems and should be avoided under all circumstances.

DATA	Model	UT6P	UT12P	UT20P	[Unit	
ELECTRICAL (rat	ted values)		the second s			
Rated voltage		1/PEAC. 230			V	
Rated frequency		50/60			Hz	
Power consumption		1.27	2.32	2 32	KW	
Connected load		1.4	2.5	25	kVA	
Current input		5.5	10.1	10.1	A	
Protection class						
Protective measure		PE terminal				
Degree of protection		IP 20				
Circuit protection to be provided at the installation location		T 1\$ A fusible link (slow-blow) or B 16 circuit-breaker				
		Connection via an earth-leakage circuit-breaker (Iripping current ≤ 30 mA) is recommended.				
£IICJI((CAI<(ra(0<) values)) > x						
Rated voltage		1/PEAC, 120	-	-	V	
Rated frequency		50/60	-	•	Hz	
Power consumption		1.27		-	kW	
Connected load		1.4	-	-	kVA	
Current Input		10.6	-	-	A	
Protection class		I	-	-		
Protective measure		PE terminal	-	-		
Degree of protection		IP 20	-	-		
Circuit protection to be provided at the installation location "		T16 A fusible link (slow-blow) or B 16 circuit-breaker				
		Connection via an earth-leakage circuit-breaker (tripping current ≤ 30 mA) is recommended.				

5) The applicable national electrical engineering regulations and technical requirements must be observed when connecting up to mains power supply circuits

©			
Component	Materials used		
Outer casing	Galvanized sheet steel, painted RAL 9002		
Heat sink (rear panel)	Aluminium		
Inner chamber	Stainless steel, material No. 1.4301		
Components litted in the chamber	Stainless steel, material No. 1.4301		
Trays	Chromium-plated steel wire		
Door seal	Seasoned silicone rubber		
Door bearing	PA, glass fiber reinforced		
Door handle	PA, glass liber reinforced		
Control unit	ABS		
Switchgear unit	PC, glass fiber reinforced		
Operator control membrane	PVS, printed polyester foil		
Feet	PPN		
Thermal insulation	Mineral fiber wool		
Filling medium - overtemp. protection device	Polydimethyldisiloxane		
Leads	PVC -sheathed copper wire		
Electronic / electrical components	Encapsulated components coated with various plastics, some mounted on glass fiber reinforced PCBs with epoxy resin		
Heating element	Stainless steel tubing filled with magnesium oxide and heating conductors		

Δ

Fibrous materials used for insulation sre ctassiried is health hazards in somt countrias. Although the fibers which may be reteased into the environment during normat operation do not constitute a serious risk, greater, more hazardous quantities may be released as a result of Improper handling during repair work or as a result of mechanical damage.
